## Interagency Autism Coordinating Committee (IACC)

Federal advisory committee that coordinates all efforts within the Department of Health and Human Services (HHS)

Established by Congress under the Children's Health Act of 2000, reconstituted under the Combating Autism Act (CAA) of 2006, and renewed under the Combating Autism Reauthorization Act of 2011.

# IACC questions determining priorities for research

---

- ◆ #1: When should I be concerned?
- ◆ #2: How can I understand what is happening?
- ◆ #3: What caused it to happen and can it be prevented?
- ◆ #4: Which treatments and interventions will help?
- ◆ #5: Where can I turn for services?
- ◆ #6: What does the future hold, particularly for adults?
- ◆ #7: What other infrastructure and surveillance needs must be met?

# IACC most recent priorities

## IACC Released the 2013 strategic plan update

- Encouraged more attention to the needs of adults with ASD
- More focus on the most disabled individuals and underserved populations
- Need for interventions for co-occurring conditions
- Developing efficacious, efficient, scalable, and cost-effective interventions, tools, and practices
- Need for interventions that can improve quality of life for individuals with ASD and their families

*Tangible Achievements in Advancing Well-Being of individuals affected by autism and their families*

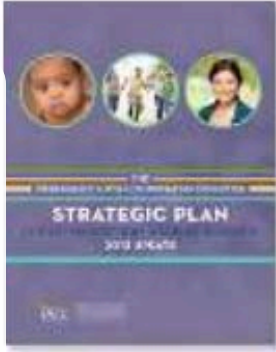

# IACC: Addressing Autism as a Public Health Challenge

---

**NIH** Eunice Kennedy Shriver National Institute of Child Health and Human Development

## IACC Released the 2013 strategic plan update

- Encouraged more attention to the needs of adults with ASD
- More focus on the most disabled individuals and underserved populations
- Need for interventions for co-occurring conditions

- Developing efficacious, efficient, scalable, and cost-effective interventions, tools, and practices
- Need for interventions that can improve quality of life for individuals with ASD and their families

# Autism as a Public Health Challenge

- Prevalence: 1 : 68 [1:42 in boys]
- Community Disparities (dx; access)
- Societal Cost/Year in the US: \$ 136 billion
- Lifetime Cost of Care Per Child: \$ 2.4 million
- Despite strong genetic bases, diagnosis is behavioral, reference standards excellent (ADI-R/ADOS/expert clinician)
- Majority of autism diagnoses in US outside academic medical centers
  - \* usage of ADI-R and ADOS in fewer than 0.1% and 2.1%, respectively
  - \* questionnaires/checklists in 30%

*CDC, 2014; Peacock et al., 2012; Cidav et al., 2012; Mandell et al., 2013; 2014; Wang et al., 2013; Buescher et al., 2014; Wiggins et al., 2006*

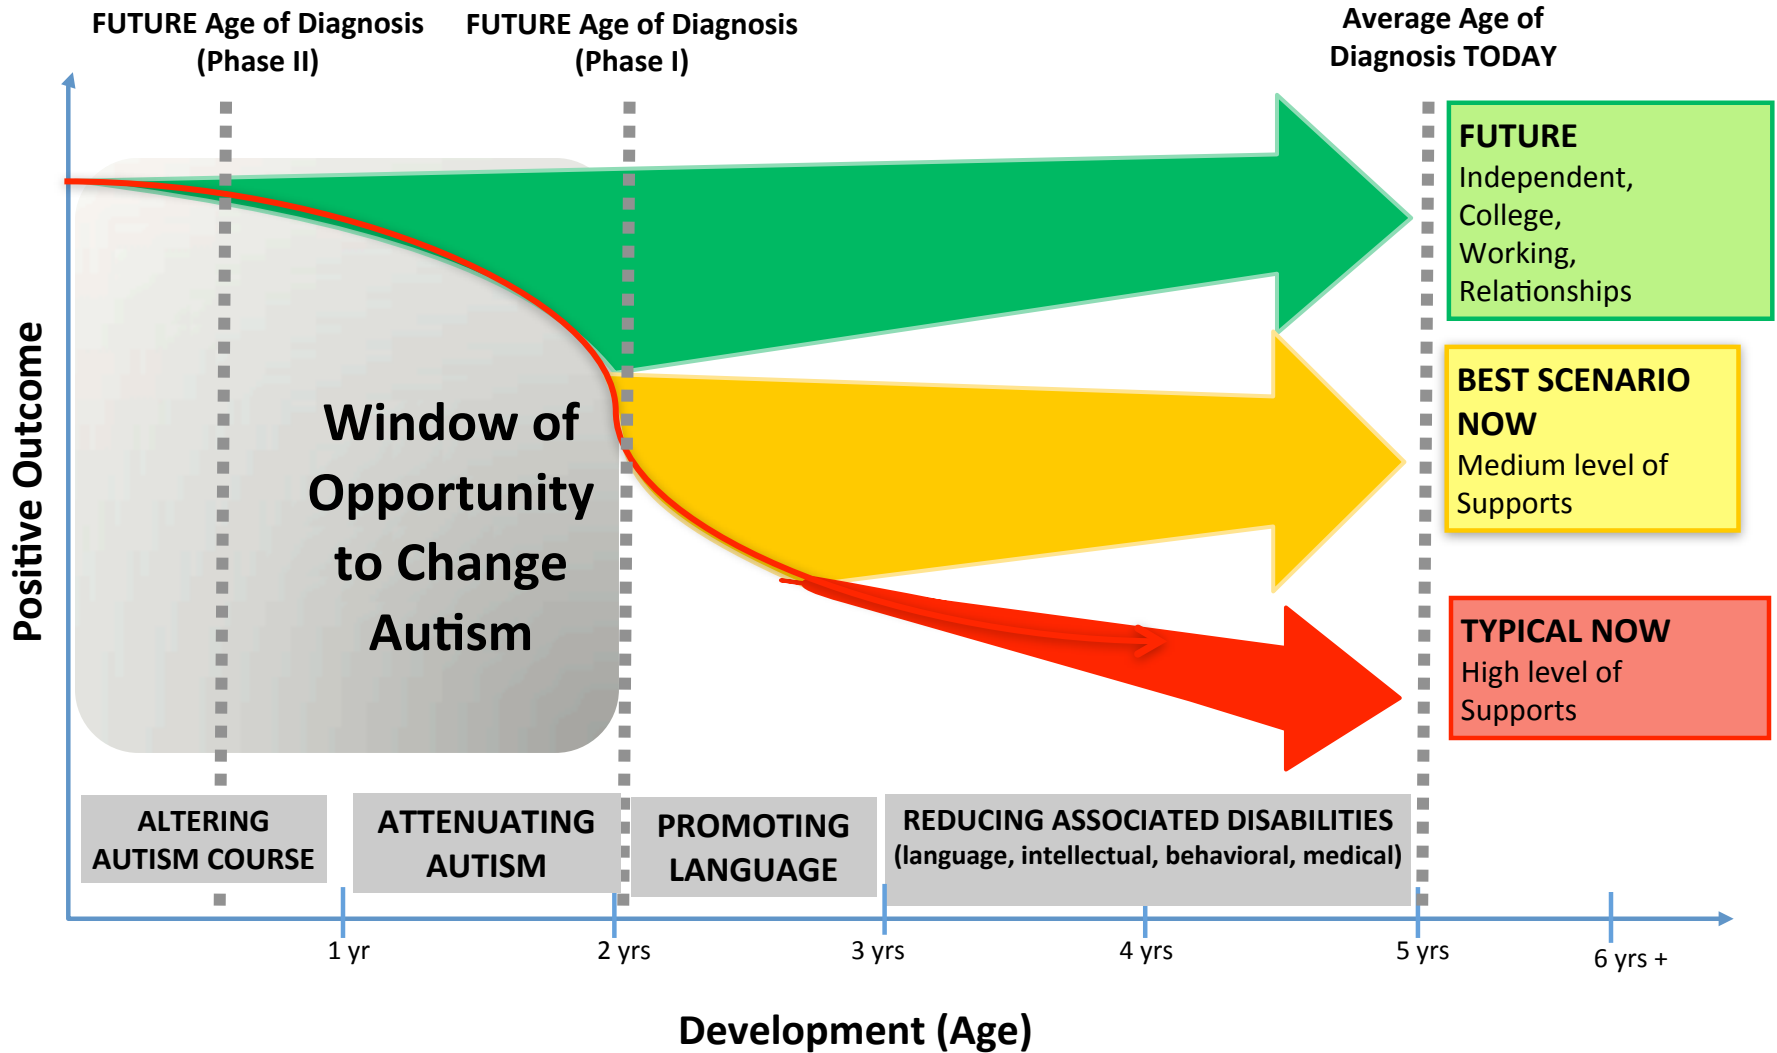

# Challenges and Opportunities: Reducing Age of Diagnosis & Improving Access to Care

---

- Brain disorder of genetic origins
- Adverse outcomes can be attenuated
- Importance of early diagnosis and intervention for lifelong outcome and cost of care
- American Academy of Pediatrics
  - Screening (18 and 24 months), but still low uptake
- 8% of primary care providers routinely screen for ASD
- Median age of diagnosis in US: 4-6 to 5.7 years
- Later still in disadvantaged communities
- No Community-viable system of care
- Reimbursement systems NOT in place

# The importance of early identification & treatment: altering the life course of children

# The Big Challenge: from Efficacy, to Effectiveness, to Uptake & Dissemination

---

- Formidable gap between innovations in health and their delivery to communities ... [the oft-quoted “10-year gap”]
- EFFICACY - EFFECTIVENESS - UPTAKE & DISSEMINATION
- Why is effective implementation such an intractable problem?
  - ◆ Because implementation has not been addressed through a research agenda
  - ◆ Although randomized controlled experiments are the gold standard for testing safety and efficacy, health delivery schemes are less likely to be subject to rigorous scientific analysis
  - ◆ The nature of the healthcare system, the stakeholder’s motivations, satisfaction and behavior, the culture-specific norms, etc., are not made subject of science

# What needs to be conquered

---

- TRANSLATIONAL ROADBLOCKS: The implementation gap
  - ◆ Barriers to rapid, efficient progression of innovations from basic science to clinical application to routine use
- TRANSLATIONAL ROADBLOCKS: Quality chasm
  - ◆ Gaps in quality, safety equity, efficiency, timeliness, and patient-centeredness of health care delivery

*Dr. Brian S. Mittman*

# What is Implementation Science

---

- Implementation Science is the study of methods to promote the integration of research findings and evidence into healthcare policy and practice.
- Implementation Science seeks to understand the behavior of healthcare professionals and other stakeholders as a key variable in the sustainable uptake, adoption, and implementation of evidence-based intervention.
- Critical to the success of major policy initiatives in healthcare, education, and in any other point of intersection between science & healthcare policy and practice -- Achievement of societal goals.

# What is Implementation Research

---

- The scientific study of methods to promote the systematic uptake of research findings and other evidence-based practices into routine practice, and hence, to improve the quality and effectiveness of health services
- It includes the study of influences on healthcare professional and organizational behavior
- It includes factors associated with the beliefs, intentions and behavior of stakeholders, cultural, societal and economic factors, and any additional factors that could potentially facilitate or hinder translation of evidence-based research into widely disseminated healthcare practice

### Parent-Implemented Social Intervention for Toddlers With Autism: An RCT

**WHAT'S KNOWN ON THIS SUBJECT:** Randomized controlled trials (RCTs) of intensive clinician-implemented interventions have demonstrated significant improvements in outcomes of toddlers and preschool children with autism spectrum disorder. RCTs of parent-implemented interventions have demonstrated improvements in parent skills, but generally they have not demonstrated effects on children's outcomes.

**WHAT THIS STUDY ADDS:** This RCT found significantly greater improvements with individual home coaching on child outcome measures of social communication, adaptive behavior, and developmental level. These findings support the efficacy of a parent-implemented intervention using little professional time, which increases potential community viability.

**AUTHORS:** Amy M. Wetherby, PhD,<sup>a,b</sup> Whitney Guthrie, MS,<sup>b,d</sup> Juliann Woods, PhD,<sup>b,c</sup> Christopher Schatschneider, PhD,<sup>d</sup> Renee D. Holland, MS,<sup>b</sup> Lindee Morgan, PhD,<sup>a,b</sup> and Catherine Lord, PhD<sup>e</sup>

#### KEY WORDS

autism, early intervention, toddlers, parent-implemented, outcomes

#### ABBREVIATIONS

ADOS—Autism Diagnostic Observation Schedule  
ASD—autism spectrum disorder  
CSBS—Communication and Symbolic Behavior Scales  
EI—early intervention  
FSI—Early Social Interaction

## The road from efficacy to effectiveness is long: 36,000-children-in-4-states long

---

- To mobilize community systems:
  - ◆ 4 Academic Centers: FSU, Cornell, Drexell, Marcus Autism Center
  - ◆ Focus on Primary Care Providers enrolled via different systems of access
  - ◆ Tools: focus groups, satisfaction surveys, penetrance measures, moderator variables, etc.
  - ◆ Results, uptake, and measures of of successful screening, diagnostic evaluations, intervention, outcomes
  - ◆ Comparison of Methods of engagement
  - ◆ Comparison across systems, opinion makers
  - ◆ Impact on local policy and resources

# If this is our ultimate goal, implementation science and research should be our collective priority

To make autism  
an issue of diversity,  
not of disability
