

NAC 2015

Early Numeracy & Beginning Math Concepts

Jared Campbell
Willow Hozella

Educational Consultants, PaTTAN Harrisburg

Pennsylvania Training and Technical Assistance Network

PaTTAN's Mission

The mission of the Pennsylvania Training and Technical Assistance Network (PaTTAN) is to support the efforts and initiatives of the Bureau of Special Education, and to build the capacity of local educational agencies to serve students who receive special education services.

2

PDE's Commitment to Least Restrictive Environment (LRE)

Our goal for each child is to ensure Individualized Education Program (IEP) teams begin with the general education setting with the use of Supplementary Aids and Services before considering a more restrictive environment.

3

Session Outline

Early numeracy **concepts and skills are essential** for continued achievement in mathematics. Structuring students' earliest experiences with mathematics in a CRA sequence can help them conceptualize the **concept of number** and provide for more **fluent and flexible counting and computation**.

Objectives

- Participants will be able to model whole numbers using **place value** concepts.
- Participants will understand the importance of the ability to **subitize** and apply to skill to teach addition and subtraction.
- Participants will be able to **utilize various tools** (ten-frame, rek-n-rek, etc.) to model mathematical concepts.

Numerical Mechanisms and Children's Concept of Numbers

Varsha Wadhawan, Aggregates Director, Indian Institute of Technology
Hyderabad, Hyderabad
Hydrocarbons Institute of Technology
24 Azim Premji Centre, Hyderabad, India
[wadhawan, aggregates, iitahd]@iitahd.ac.in

The numeric systems invented vary across time and place, and there is no doubt that the properties of such a system can facilitate or impede the development of children's mathematical understanding.

Chinese (and Asian languages based on ancient Chinese) are organized such that the numerical names are compatible with the traditional 10-base numeration system. So spoken numbers correspond exactly to their written equivalent: 15 is spoken as "ten five" and 57 as "five ten seven."

Most European systems of number words are irregular up to 100. For example in French, 92 is said as "four twenty twelve," corresponding to $4 \times 20 + 12$.

The more complicated the number word system is, the harder it is for children to learn the counting sequence.

http://web.media.mit.edu/~stefanm/society/som_final.html

Interpreting Numbers

1. What is this number?
2. What is the meaning of this number?

3264

Decimal (base 10)

18	Eighteen	One ten, Eight	81	Eighty-one	Eight tens, one
19	Nineteen	One ten, Nine	99	Ninety-nine	Nine tens, nine

What is Number Sense?

“a child's fluidity and flexibility with numbers, the sense of what numbers mean, and an ability to perform mental mathematics and to look at the world and make comparisons”

(Gersten & Chard, 1999)

CRA Sequence of Instruction

- 1 - Introduce the mathematical concept(s)
- 2 - Teach and practice modeling procedures concretely
- 3 - Connect the concrete to a representation of the concrete
- 4 - Practice modeling the procedure representationally
- 5 - Connect the representation to the abstract symbols
- 6 - Practice the abstract modeling of the procedure
- 7 - Make connections between all three models to help students monitor their thinking and choice of representation
- 8 - Provide opportunities for student choice.

CRA

- Concrete (sense making by moving)
- Representational (sense making by drawing)
- Abstract (sense making with symbols)

CONSISTENT LANGUAGE

Rationale – Doing What Works

Research-based studies show that students who use concrete materials develop **more precise and more comprehensive mental representations**, often show more motivation and on-task behavior; understand mathematical ideas, and better apply these ideas to life situations.

(Harrison, & Harrison, 1986)
(Suydam & Higgins, 1977)

Concrete-Representational-Abstract Instructional Approach Summary Report—
The Access Center, American Institutes for Research, Washington, DC

<http://dewey.ed.gov> **DOINGWHATWORKS**

Why would CRA be effective?

- Multimodal forms of math acquisition to aid memory and retrieval
- Meaningful manipulations of materials allows students to rationalize abstract mathematics
- Procedural accuracy; provides alternate to algorithm memorization

(Witzel, Riccomini, & Scheider, 2008)

Other Research.

- Direct Instruction
- Errorless Teaching
- Formative Assessment
- Correct Feedback
- Improved Teacher Content Knowledge
 - Task Analyze
 - Instruct on Specific Skills or Process
 - Monitor progress
 - Correct errors

Something here...

- Multimodal forms of math acquisition to aid memory and retrieval
- Meaningful manipulations of materials allows students to rationalize abstract mathematics
- Procedural accuracy; provides alternate to algorithm memorization

Students having difficulties with math...

- Counting seen as rote, mechanical, left to right, 1:1 correspondence only; INEFFECTIVE
- Automaticity problems take up working memory, inhibit discourse & algebraic thinking

(Gersten, Jordan, & Flojo, 2005)

Concept of Number

"What does three really mean?
What is three-ness"

-M

Pennsylvania Training and Technical Assistance Network

What is Number Sense?

"a child's fluidity and flexibility with numbers, the sense of what numbers mean, and an ability to perform mental mathematics and to look at the world and make comparisons"

(Gersten & Chard, 1999)

What does "3" really mean?

3 three "three" ● ● ●

"1 ... 2 ... 3!"

"one more than 2"

"one less than 4"

"is between..."

"is more than..."

- Missing Number
- Applications

Basic Principles of Counting

Numerical Mechanisms and Children's Concept of Numbers

One-to-one – Counting one “thing” at a time; transfer from uncounted group to counted group (**1:1 Correspondence**)

Stable-order – Establishes consistent sequence

Cardinal – The last count represent the quantity in the counted group (**Cardinality**)

Abstraction – applying counting to like objects, actions, sounds, etc...

Order-irrelevance – Can count in any order

Stages of Early Arithmetical Learning

The Stages of Early Arithmetical Learning (SEAL) classifies the various strategies used by children into six stages:

Stage	Indicators
Stage 0: Emergent Counting	Cannot count visible items. The child may not know the number words. The child cannot coordinate number words with items.
Stage 1: Perceptual Counting	Can count perceived items. May involve seeing, hearing or feeling items.
Stage 2: Figurative Counting	Can count the total of two collections. Counts from one.
Stage 3: Initial Number Sequence	Child uses and understands counting-on rather than counting from one. Uses counting on to solve addition and missing addend tasks. May use count-down-from strategies.
Stage 4: Intermediate Number Sequence	The child uses and understands: • count-down-from strategies • count-down-to strategies The child can choose the most efficient strategy.
Stage 5: Facile Number Sequence	The child uses a range of non-count by one strategies: • Compensation • Using known results • Adding to ten • Commutativity • Subtraction as the inverse of addition • Awareness of ten as a teen number

Wright, R., Martland, J., Stafford, A., & Stanger, G. (2006). *Teaching Number: Advancing Children's Skills and Strategies*. London: Sage.

What is Number Sense?

“a child's fluidity and flexibility with numbers, the sense of what numbers mean, and an ability to perform mental mathematics and to look at the world and make comparisons”

(Gersten & Chard, 1999)

From Counting to Computation

... or more efficient counting

Pennsylvania Training and Technical Assistance Network

What is the sum? *Strategies*

1000 + 32 = 1032 - 1 *Compensation*

999 + 32 = 1031

999 + **1 + 31** = 1000 + 31 *Decomposition*

Decomposition & Compensation *Strategies*

Decomposition – decomposing numbers to compute faster

- ✓ make a 5
- ✓ make a 10
- ✓ doubles (± 1)

Compensation – Adjust the problem to compute, then readjust the answer

- ✓ may utilize known facts.

The Doubting Teacher
Do they "see" what I "see"?
How do I know?

The Mathematics Framework, Appendix F

Levels	$8 + 6 = 14$	$14 - 6 = 8$
Level 1: Count all	Count All	Take Away
Level 2: Count on	Count On	Think +
Level 3: Recompose Make a ten (general): one addend breaks apart to make 10 with the other addend Make a ten (from 5's within each addend)	Make 5/10	From 5/10
Doubles = n	$6 + 6 = 12$ $= 6 + 6 + 2 = 12 + 2 = 14$	

Note: Many children attempt to count down for subtraction, but counting down is difficult and error-prone. Children are much more successful with counting on, it makes subtraction as easy as addition.

$$60 + 3$$

Ten Frame Ideas

Rekenrek

Pennsylvania Training and Technical Assistance Network

Vocabulary

Rekenrek (wreck-n-wreck)

The Rekenrek (also called an arithmetic rack) has emerged as perhaps the most powerful of all models for young learners.

Developed by mathematics education researchers at the highly regarded Freudenthal Institute in the Netherlands.

Designed to reflect the natural intuitions and informal strategies that young children bring to the study of numbers, addition, and subtraction.

Provides a visual model that encourages young learners to build numbers by

- groups of five
- groups of ten
- doubling and halving strategies
- counting-on from known addition/subtraction

73

Rekenrek

74

Some activities...

- **See & Slide** – Given #, make in 1 move.
- **Build a Number** – move first row, how many more on second row
- **Show Me** – Give number, make combination
- **Flash Attack** – Show beads, get number

THE REKENREK

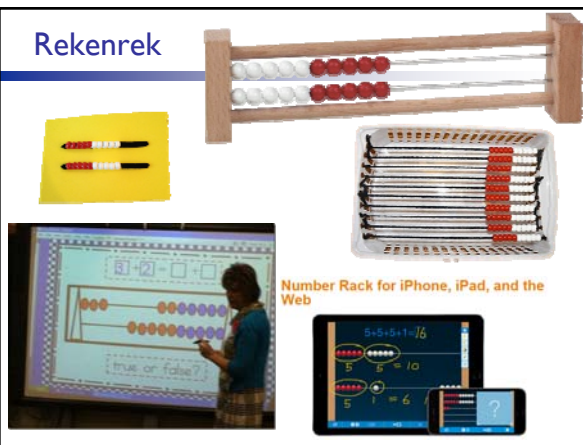

The **Rekenrek** is a powerful tool that supports children to

- develop/reinforce cardinality (visualization of groupings),
- develop one-to-one counting (organizes the count),
- allows those who still need to count by ones to do so, but also helps children to build towards counting on,
- visualize and build number relationships, and
- work flexibly with numbers by encouraging decomposition strategies.

Levin NESEA Spring 2012
