

Developing Skill-Based Interventions Following Practical Functional Assessments of Problem Behavior

Joshua Jessel
PhD, BCBA-D

National Autism Conference Workshop
7/31/2017

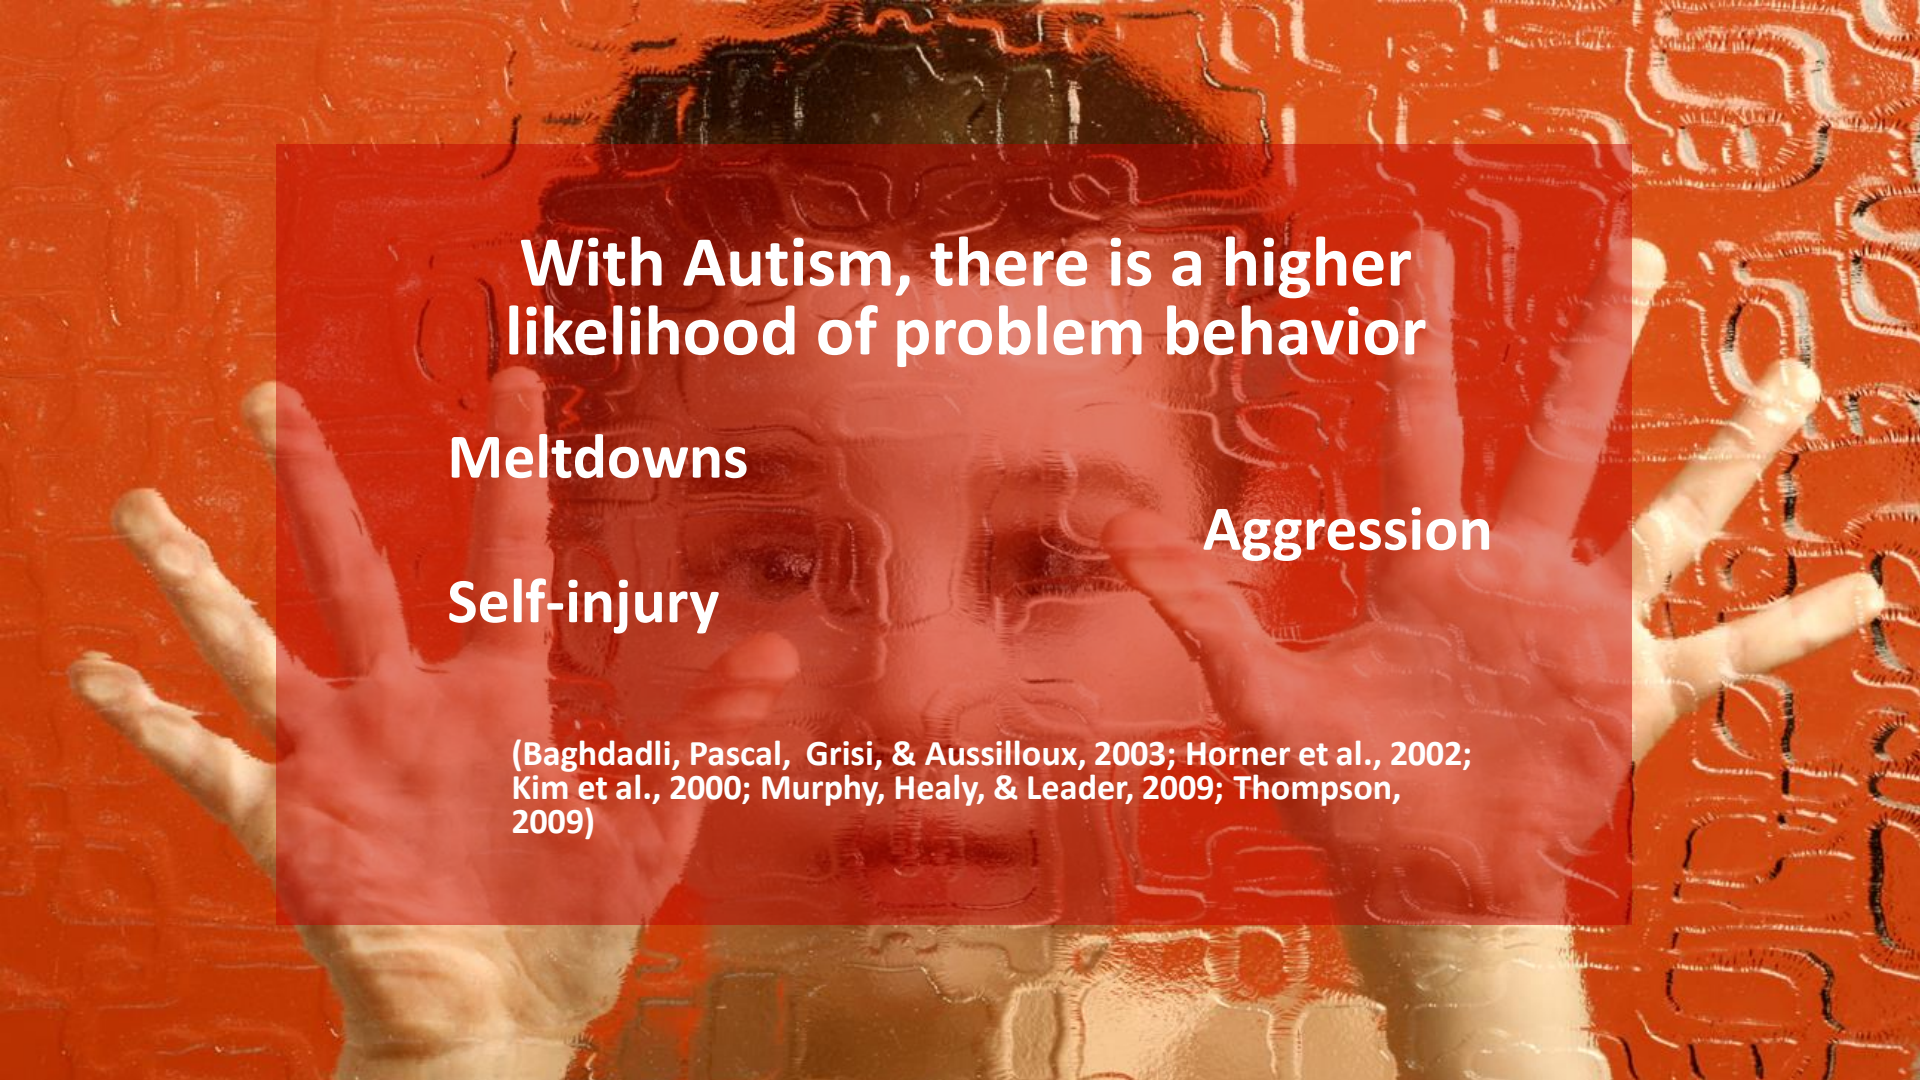

Autism is characterized by

- 1. Impairments in language development and social interaction**
- 2. Excessive repetitive behavior**

A photograph of a woman with long dark hair and a young girl with light brown hair in a field. The woman is on the left, wearing a blue polka-dot top, and the girl is on the right, wearing a pink shirt and a white apron. They are both looking at a dandelion seed head that the woman is holding. The background is a lush green field with trees in the distance. A semi-transparent red box is overlaid on the image, containing white text.

But what is the most difficult issue for
parents and teachers of most children and
young adults with autism?

**With Autism, there is a higher
likelihood of problem behavior**

Meltdowns

Aggression

Self-injury

**(Baghdadli, Pascal, Grisi, & Aussilloux, 2003; Horner et al., 2002;
Kim et al., 2000; Murphy, Healy, & Leader, 2009; Thompson,
2009)**

A close-up photograph of a young child with blonde hair, wearing a blue jacket, blowing bubbles. The child's face is partially obscured by a semi-transparent red rectangular box containing white text. The background is blurred, showing green foliage and several colorful bubbles in the air.

**Over 60% of children diagnosed with
Autism exhibit some form of problem
behavior such as:**

Meltdowns

Aggression

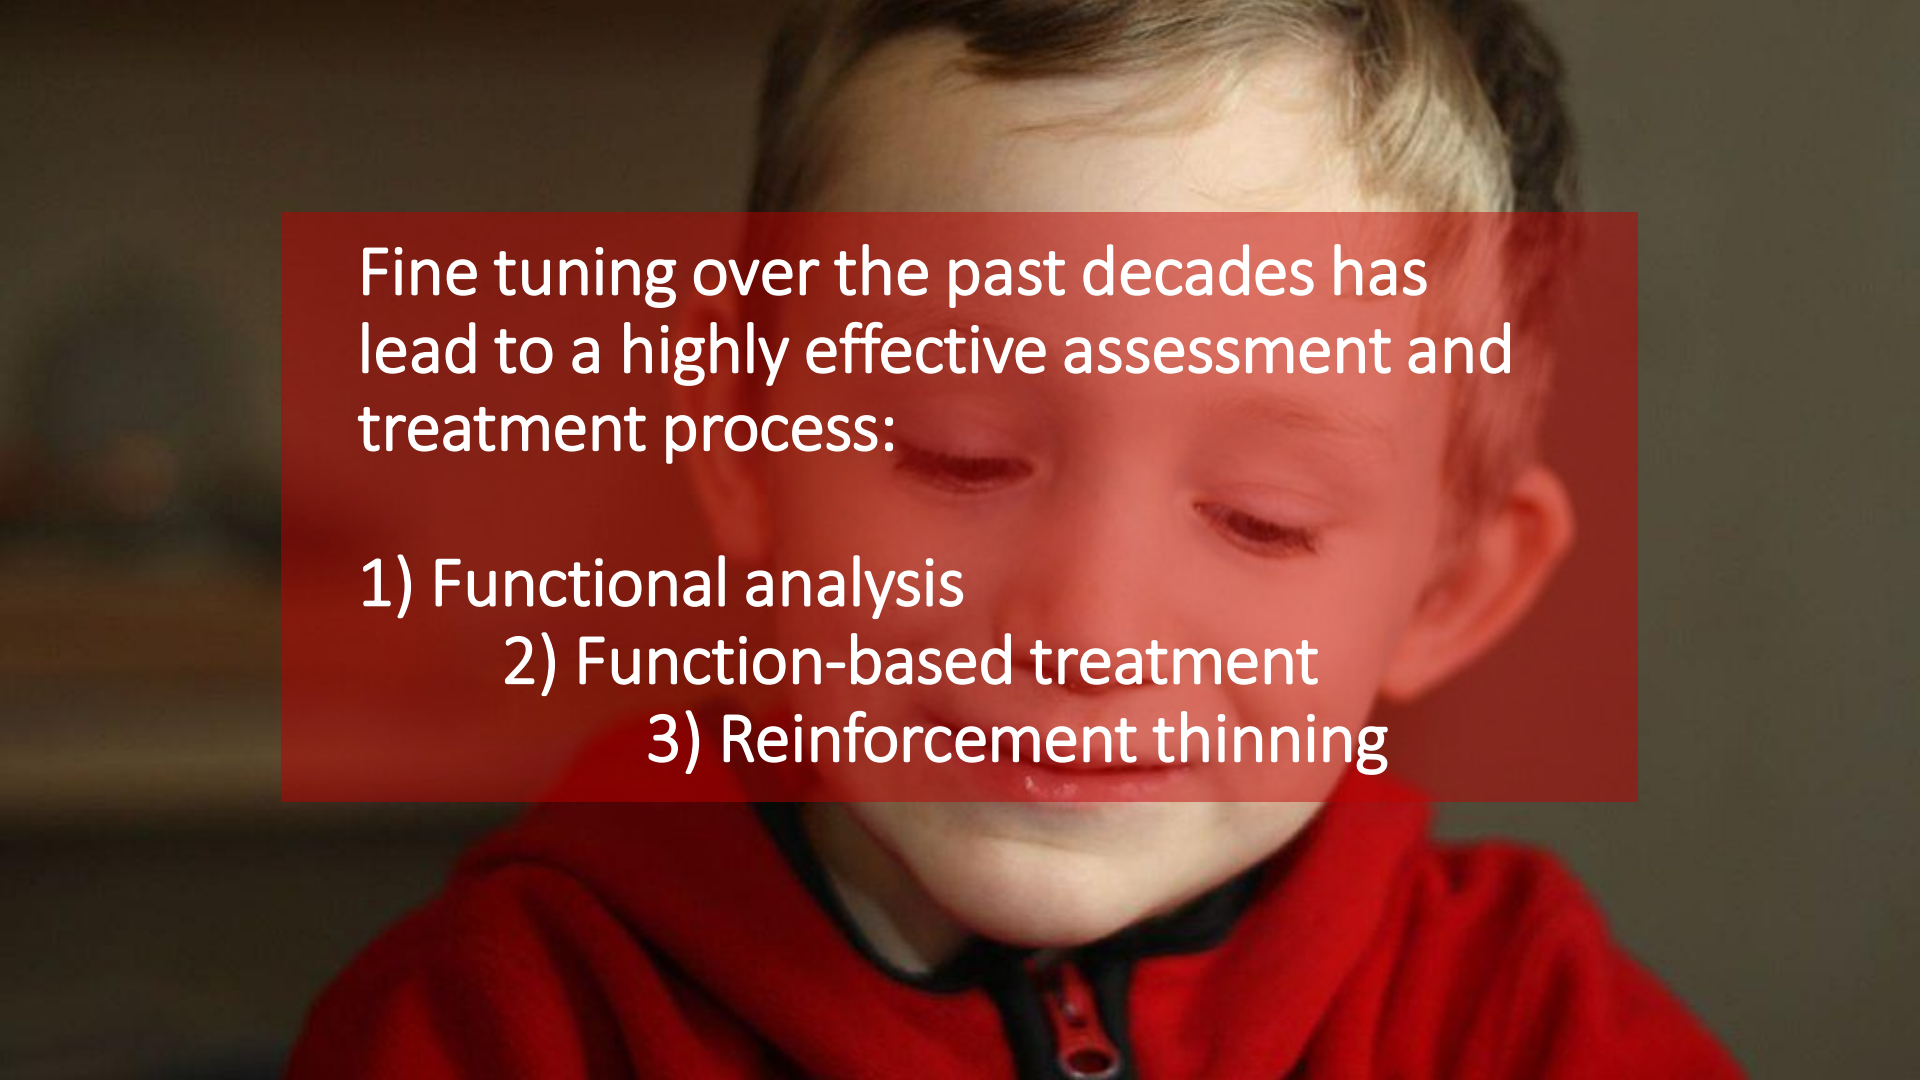

Self-injury

I can never eat out
with my family
because of my
son's tantrums in
restaurants

Caregiver Testimonies

Almost every day I have
to leave work early to
pick up my son from
school because his
aggression is too severe
to manage

It is hard to see
grandma and grandpa
because they could
really get hurt

Fine tuning over the past decades has lead to a highly effective assessment and treatment process:

- 1) Functional analysis
- 2) Function-based treatment
- 3) Reinforcement thinning

Standardization of a Functional Analysis Model

- **Multiple test conditions:** Attention, escape, alone, tangible
- **Uniform test conditions:** same procedures for all participants
- **Isolated test conditions:** reinforcers evaluated independently
- **Play control:** One control for all test conditions including unrelated leisure items
- **Only dangerous behavior:** Minimal response class excluding precursors or non-dangerous behavior

(Jessel, Hanley, & Ghaemmaghami, under review)

Respondents reported using informant and descriptive assessments more frequently than functional analyses, and a majority of respondents (63%) indicated that they “never” or “almost never” used functional analyses to identify the function of behavior. This is concerning, given the research that has demonstrated the unreliability of indirect FBA methods (Arndorfer

Oliver, Pratt, & Normand (2015)

“...Seemed unsafe and often inconclusive...”

“...takes too much time and resources...”

Results of the current survey indicated that the majority of respondents reported using descriptive assessment more often than functional analysis for identifying the function of problem behavior. Although this finding replicates pre-

Roscoe et al. (2015)

Obstacles:

#1: Take too much time

#2: Too complex

#3: Too risky for client or analyst

#4: Difficult to “sell” to constituents

#5: Can't be used for dangerous behavior

#6: Can't address low-rate problem behavior

#7: Can't address covert problem behavior

#8: Can't address multiple topographies or functions

#9: Can't address constantly changing reinforcers

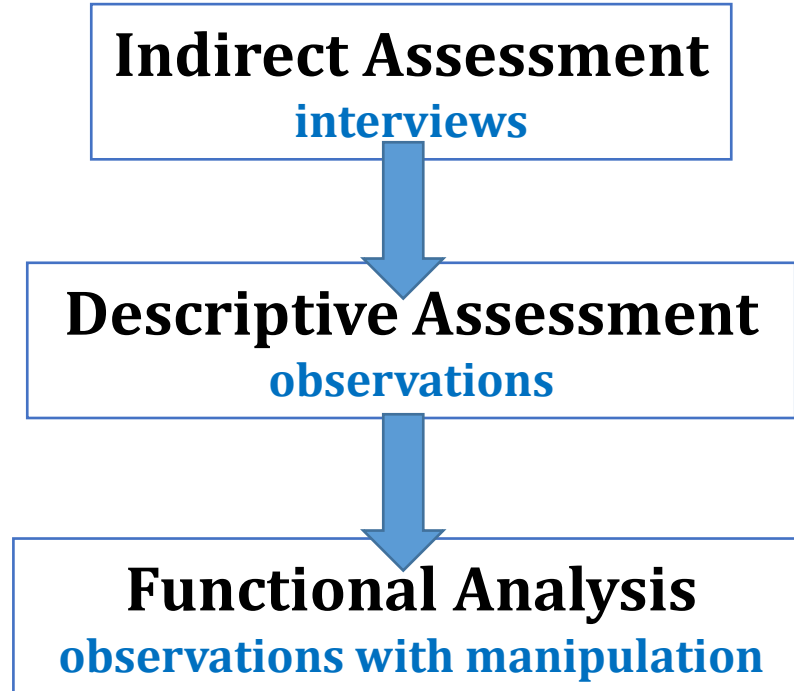

We need an assessment not designed for researchers but an assessment that embodies the elements important to practitioners

Quick

Practical

Cost efficient

Practical Functional Assessment Process

This is your girlfriend →

**Your girlfriend likes
to get ice cream
from this ice cream
truck and you want
to know why**

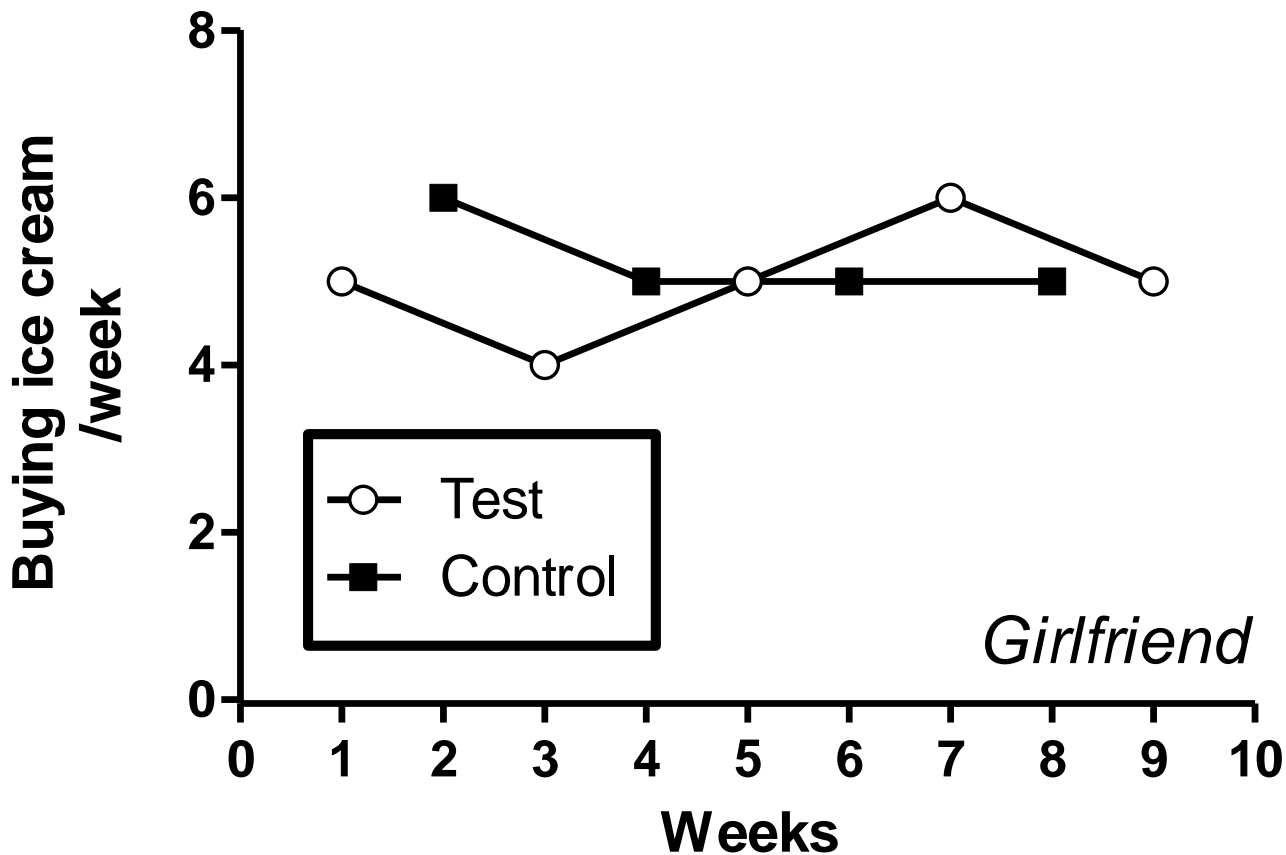

- **What do you start with?**
 - Indirect assessment
 - Q: “Why do you go to that ice cream truck?”
 - A: “To buy ice cream.”
- **Next step?**
 - Possibly direct assessment

- **Last step?**
 - **Functional analysis**
 - **Control condition:**
 - Give her all the ice cream for free
 - Pay truck to not sell ice cream anymore
 - **Test condition:**
 - Starve her of ice cream
 - Tell the truck to sell ice cream again

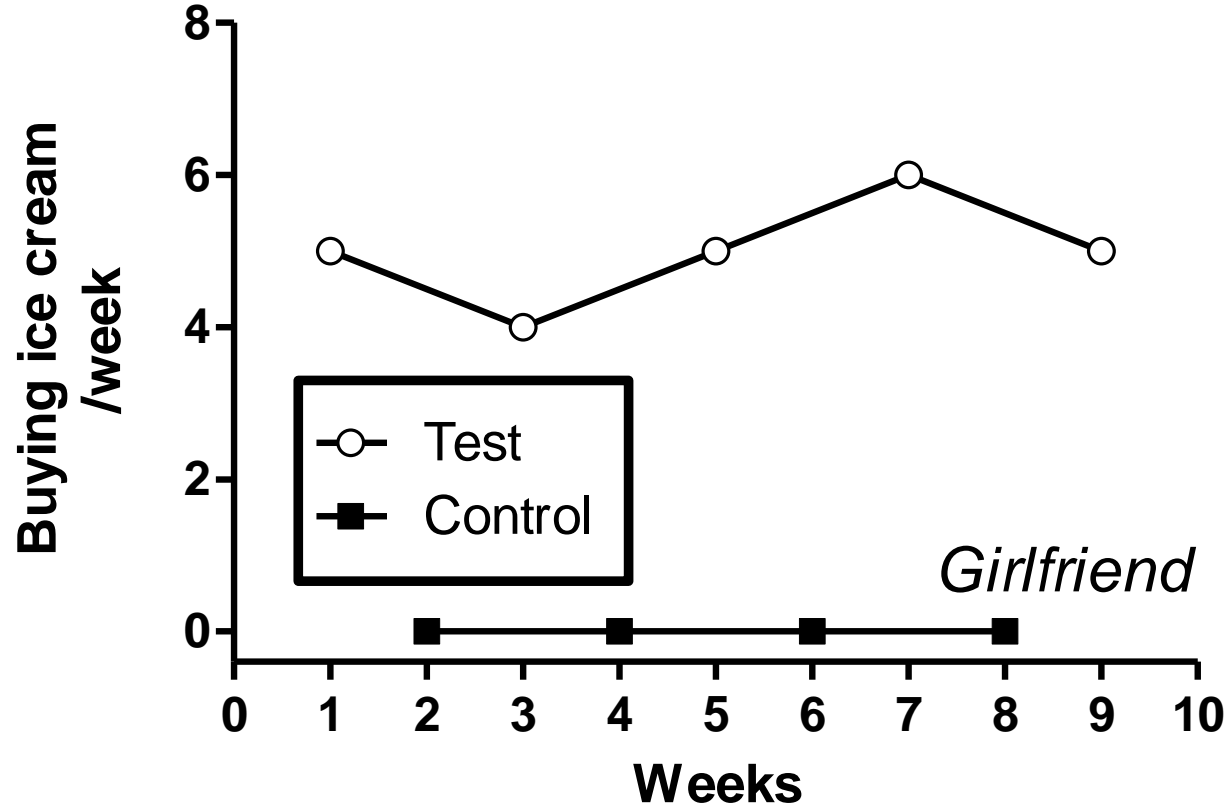

Is your girlfriend's buying ice cream maintained by the production of ice cream?

You also noticed during your direct assessment that the ice cream truck driver looks like this

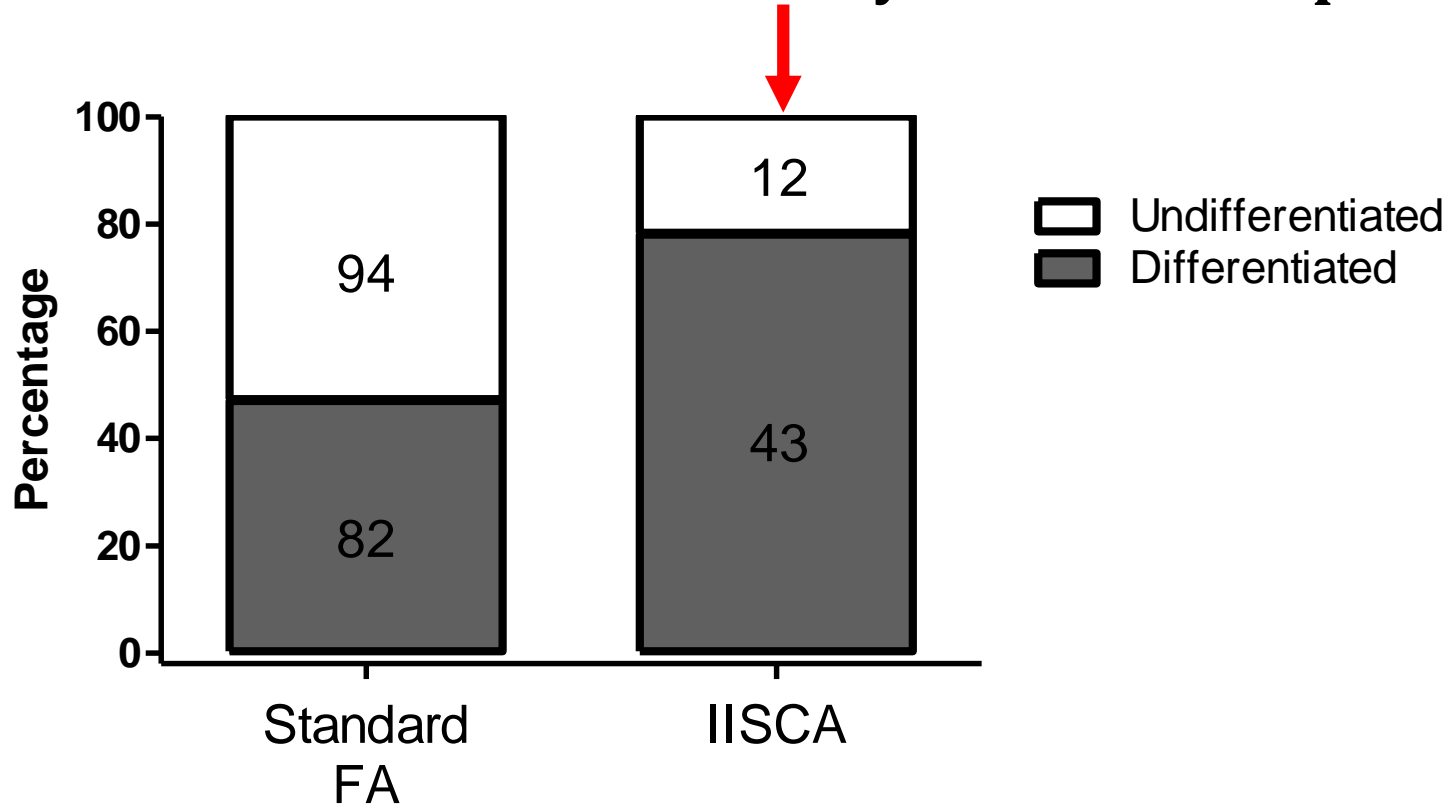

- **So you conduct another functional analysis**
 - **Test condition: Hottie Mc Hottie sells her ice cream**
 - **Control: Not so Hottie Mc Hottie sells her ice cream**

- So you conduct another* functional analysis

***Disclaimer: unlikely to need multiple tries**

Case Example (Mike, 8 yo, dx: PDD-NOS)

Team: Hillary Kirk, Ruth Whipple (2:1 tutors); Joshua Jessel (supervising BCBA-D)

Setting: Outpatient Clinic

Interview (15 min)

Total time until
treatment: 45 min

Observation (5 min)

Analysis (25 min)

Case Example (Mike, 8 yo, dx: PDD-NOS)

Team: Hillary Kirk, Ruth Whipple (2:1 tutors); Joshua Jessel (supervising BCBA)

Setting: Outpatient Clinic

*Interview suggested that
Mike engaged in meltdowns
and aggression....*

***Problem
Behavior***

***when someone directed or
engaged with him during his
play....***

***Context
(suspected
establishing
operations)***

***in order to gain independent
and child-oriented play with
preferred items***

***Outcome
(suspected
reinforcers)***

Suspected reinforcing contingency

Case Example (Mike, 8 yo, dx: PDD-NOS)

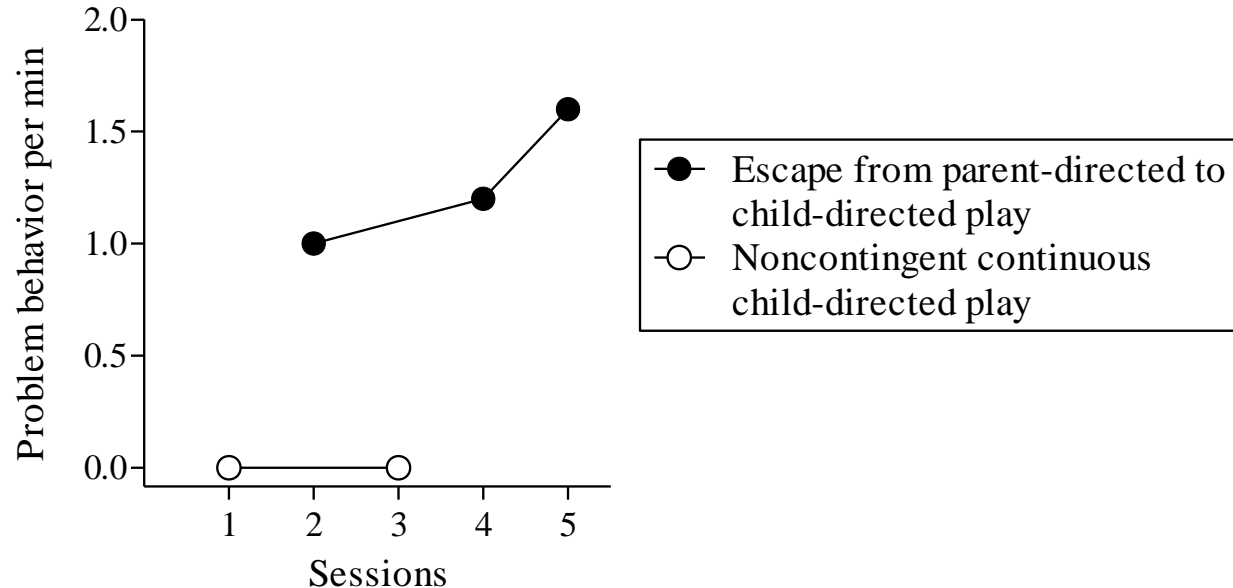

Team: Hillary Kirk, Ruth Whipple (2:1 tutors); Joshua Jessel (supervising BCBA)

Setting: Outpatient Clinic

Hypotheses:

Mike engages in meltdowns and aggression in order to obtain:

Independent access to leisure items

*PRODUCING MEANINGFUL IMPROVEMENTS IN PROBLEM
BEHAVIOR OF CHILDREN WITH AUTISM VIA SYNTHESIZED
ANALYSES AND TREATMENTS*

GREGORY P. HANLEY, C. SANDY JIN, NICHOLAS R. VANSELOW, AND
LAURA A. HANRATTY

WESTERN NEW ENGLAND UNIVERSITY

Problem behavior per min

Sessions

What is and is not our approach?

Our approach is

Inductive – we never know what the analysis will look like until we meet the family

Intuitive – we listen to the families and solve the problems they tell us they have

Our approach is NOT

Standardized – we do not fit each child in a ready made analysis

Assumptive – we do not believe we know the problem better than the family

Three Steps to Conducting a Practical Functional Assessment

Step 1: Open-Ended Interview

The open-ended interview allows the therapist to:

- a) Develop rapport with parents or teachers**
- b) Identify unique contingencies**
- c) Develop “function hunches”**
- d) Set up a safe and quick analysis**

Disclaimer: Information from the interview is to be used to inform the subsequent observation and analysis and not interpreted alone.

2. Describe his/her language abilities.

☐ Non-verbal ☐ 1-word utterances ☐ Short disfluent sentences ☐ Full fluency

Comments:

7. What are the problem behaviors? What do they look like?

☐ Aggression ☐ Disruption ☐ SIB ☐ Other

Comments:

12. Under what conditions or situations are the problem behaviors most likely to occur?

13. Do the problem behaviors reliably occur during any particular activities?

14. What seems to trigger the problem behavior?

TO DETERMINE THE CONSEQUENCES

17. How do you and others react or respond to the problem behavior?

18. What do you and others do to calm him/her down once he/she engaged in the problem behavior?

19. What do you and others do to distract him/her from engaging in the problem behavior?

7. What are the problem behaviors? What do they look like?

☐ Aggression

☐ Disruption

☐ SIB

☐ Other

Comments:

Bobby hits himself and scratches himself. He starts to scream and then will repeatedly slap himself in the face until it is red and raw.

13. Do the problem behaviors reliably occur during any particular activities?

I would say it definitely occurs most during his cleaning time. He has OCD like behaviors and every time he comes home he has to put his papers in a certain way, reorganize stuff, and move things around.

19. What do you and others do to distract him/her from engaging in the problem behavior?

There is no way of distracting him. We try to give him the activities that he likes or try to move him to a different area but the second we get close he will start screaming and slapping himself. The only way to calm him down is to give him his space and let him do his thing.

1. Target problem behavior:

Topography #1 Screaming

Operational definition:

Vocalizations louder than conversational speech including screeches, yelling, or howling

Topography #2 Face slapping

Operational definition:

Attempts to or successful open handed hit to face from more than three inches away from face and causes audible hit

Topography #3 Self scratching

Operational definition:

Attempts to or successfully moving nails at least one inch down arm or stomach creating visible redness and tearing of skin

Test condition procedures

Bait the room with items he likes to clean and arrange in somewhat disarray. For example, have papers unorganized, have drawers open with items on the ground, etc. Give him 30 s access to the items before session and then begin to block him while providing the prompt, “you can’t clean anymore. It is time to come with me.” If he engages in SIB say, “ok, don’t worry, you can clean” and give him at least one arms length of space for 30 s. Repeat after 30 s.

Control condition procedures

Bait the room with items he likes to clean and arrange in somewhat disarray. Provide him with independent access to the same items with at least one arms length of space the entire time. Ignore any problem behavior if it occurs.

12. Under what conditions or situations are the problem behaviors most likely to occur?

I would say it happens randomly but he sure does love his iPad. We can only afford one and sometimes his sister, Sarah, tries to play with him. She'll sit next to him and sort of look over his shoulder telling him how to play, touching some buttons. You can usually see him start to get annoyed with her and at some point he will explode.

17. How do you and others react or respond to the problem behavior?

It's like clockwork. If I am in the other room I'll hear him scream and before you know it Sarah will get hit and come crying to us. We try to just explain to her that he has autism and that we just need to give him his own time with the iPad.

Describe what you would do in the test condition of the functional analysis.

Describe what you would do in the control condition of the function analysis.

Interview tips:

- 1. Let the interviewee determine the pace but keep control of the conversation**
- 2. You don't need to ask every question or go in order**
- 3. You are finished when you know the problem behavior and can arrange the context**
- 4. Be as detailed as possible with relevant information**
- 5. Always keep the analysis structure in mind**
- 6. Ask for descriptions not explanations**

Step 2

Brief Observation

The brief observation allows the therapist to:

- a) Test some of those hunches from the interview**
- b) See the topographies of problem behavior first hand**
- c) Formalize the analysis conditions**

Disclaimer: Do not rely on extended periods of indirect observations. Keep it brief and try those contingencies out. Tweak when necessary and go until you are confident in the variables you will be evaluating in your analysis.

Brief observation tips:

- 1. If you consistently see problem behavior evoked by the removal/presentation of parent described event(s) and problem behavior eliminated by the removal/presentation of parent described consequence(s) move to the analysis**
- 2. Keep the parent in the room when possible for continued input**
- 3. Look for less severe precursors that may not have been mentioned during the interview**
- 4. When in doubt use parents**
- 5. Remember, you're not trying to cause a problem, you're trying to understand one**

Step 3

Functional Analysis

The functional analysis allows the therapist to:

- a) Create an understanding of behavior rather than a hunch
- b) Hold themselves to the same standards as any medical professional
- c) Establishes a baseline from which to evaluate the treatment

Definition: Direct observation of behavior under **two** conditions in which some event is manipulated

Two Conditions:

Test: Contains the reinforcing contingency thought to maintain severe problem behavior

Control: *Does not* contain the reinforcing contingency thought to maintain severe problem behavior

"Everytime I try to teach John how to play with the toys appropriately, he starts to throw a tantrum and tries to bite my hand."

Based on this example how will you arrange your analysis?

- a) Two test conditions: One in which I provide him with prompts and give him 30-s of escape contingent on problem behavior. And a second condition where I take away toys and give him 30-s access to the toys contingent on problem behavior.**
- b) One test condition: I provide him with prompts teaching him how to play with the toy and give him 30-s of escape to independent access to those toys contingent on problem behavior.**
- c) On test condition: I only test the tangible function because the prompts are related to play and irrelevant.**

Hint: How many sushi lovers are there out there?

A close-up photograph of a sashimi platter. In the foreground, there is a large, thick stack of tuna sashimi, showing its deep red color and distinct muscle fibers. To its left, a smaller stack of salmon sashimi is visible, with its characteristic orange-pink hue. The platter is garnished with several elements: a bright yellow lemon wedge, a slice of red tomato, a small sprig of green parsley, and a piece of green shiso leaf. A pile of finely shredded white daikon radish sits between the two main stacks of fish. The entire dish is presented on a dark, textured plate, likely made of slate or a similar material. The background is a light-colored wooden surface.

Now how many of you love sashimi?

SPOILER ALERT

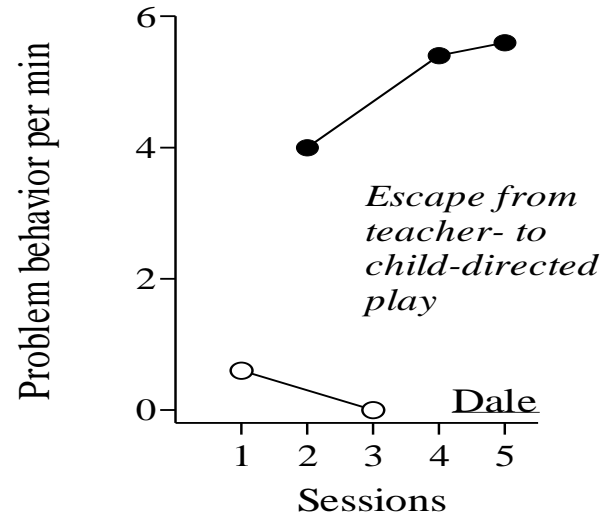

Rice
+ Sashimi
Sushi

?!?!

For some of you the synthesis of rice and sashimi (i.e., sushi) is a reinforcer whereas the isolated components of rice alone or sashimi alone would not be

"Everytime I try to teach John how to play with the toys appropriately, he starts to throw a tantrum and tries to bite my hand."

Based on this example how will you arrange your analysis?

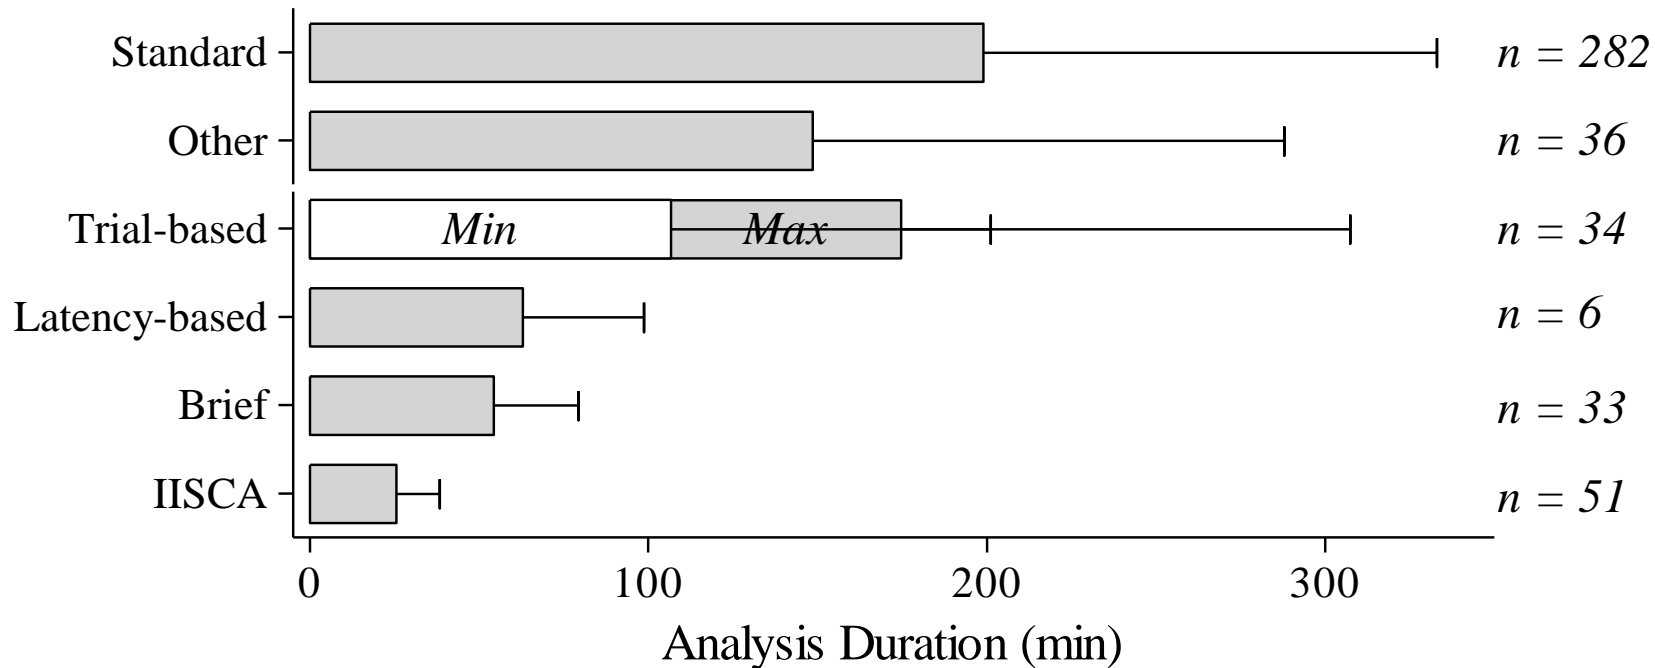

- Two test conditions: One in which I provide him with prompts and give him 30-s of escape contingent on problem behavior. And a second condition where I take away toys and give him 30-s access to the toys contingent on problem behavior.
- One test condition: I provide him with prompts teaching him how to play with the toy and give him 30-s of escape to independent access to those toys contingent on problem behavior.
- On test condition: I only test the tangible function because the prompts are related to play and irrelevant.

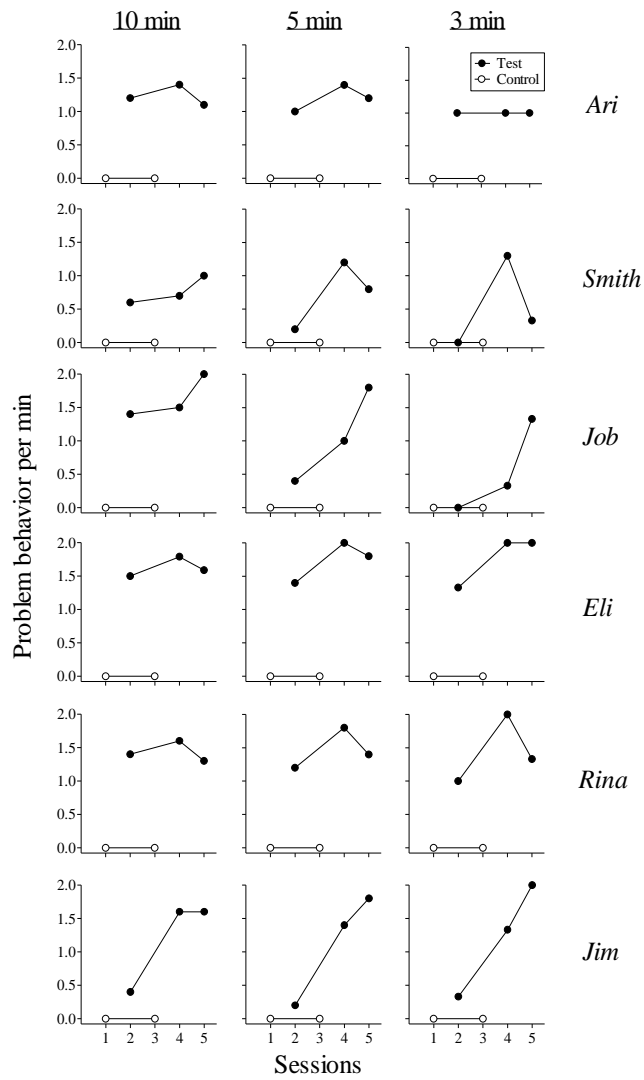

Final Commitments to a Practical Functional Assessment

Commitment #1

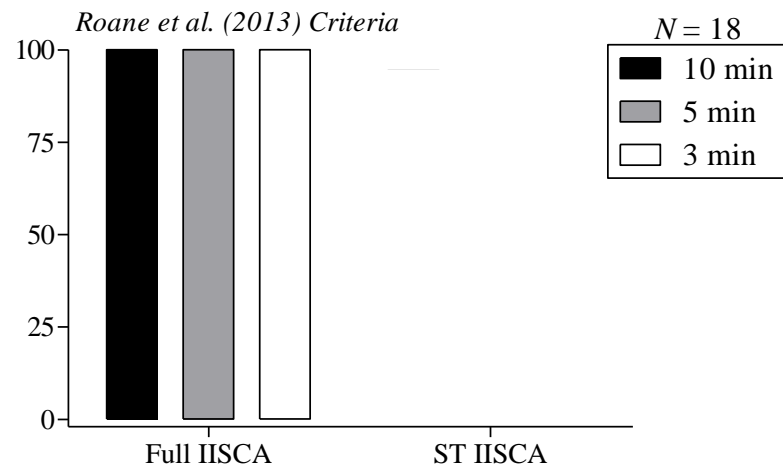

We are committed to an *efficient* analysis that minimizes assessment time and maximizes treatment exposure

Functional analysis format
(2007-2016)

Percentage of Applications with Control

With this format you don't need:

20 min sessions

15 min sessions

10 min sessions

You can use:

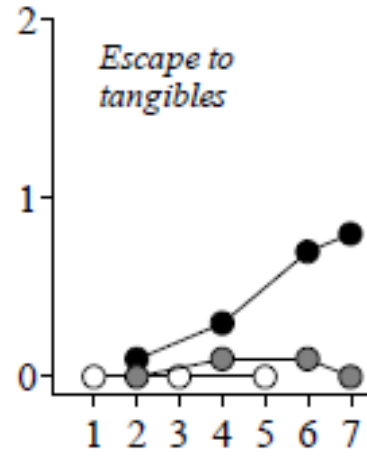

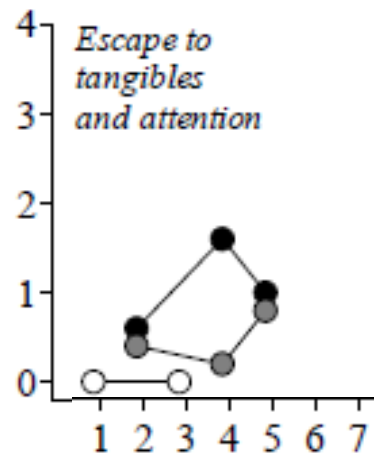

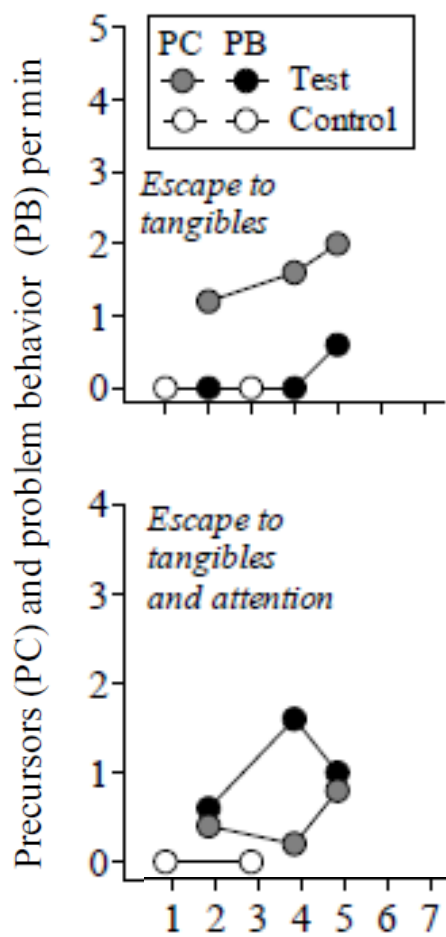

5 min sessions

3 min sessions

And still produce clear and consistent results

Commitment #2

We are committed to a *safe* analysis that minimizes exposure to potentially dangerous contexts intended to evoke problem behavior

10. Describe the range of intensities of the problem behaviors and the extent to which he/she or others may be hurt or injured from the problem behavior.

High range: Johnny has hit his sister so hard that she has gotten a concussion before

Moderate range: He scratches her daily but it is more manageable than his hitting

Low range: The yelling is definitely on the low range but it can get very annoying

Comments: Johnny's hitting is the bad behavior we are most worried about. We hope that you can help us to get him to stop hitting.

Would you:

- A) Only include the severe problem behavior of hitting
- B) Only include the moderate problem behavior of scratching
- C) Only include the non-dangerous behavior of yelling
- D) Include A and C
- E) Include A, B, and C

Change in Components

- Multiple test conditions → **Single test condition**
- Uniform test conditions → **Individualized test condition**
- Isolated test conditions → **Synthesized test condition**
- Play control → **matched control**
- Only dangerous behavior → **Include non-dangerous behavior**

Age and Sex

1.8 to 30 years old
males and females

Diagnoses

ASD, PDD-NOS,
GAD, ADHD, no
diagnosis

Language Ability

Non-verbal, 1-
word utterances,
difficult sentences, fluent
sentences

Replications of the IISCA

(Jessel, Hanley, & Ghaemmahami, 2016)

Problem Behavior

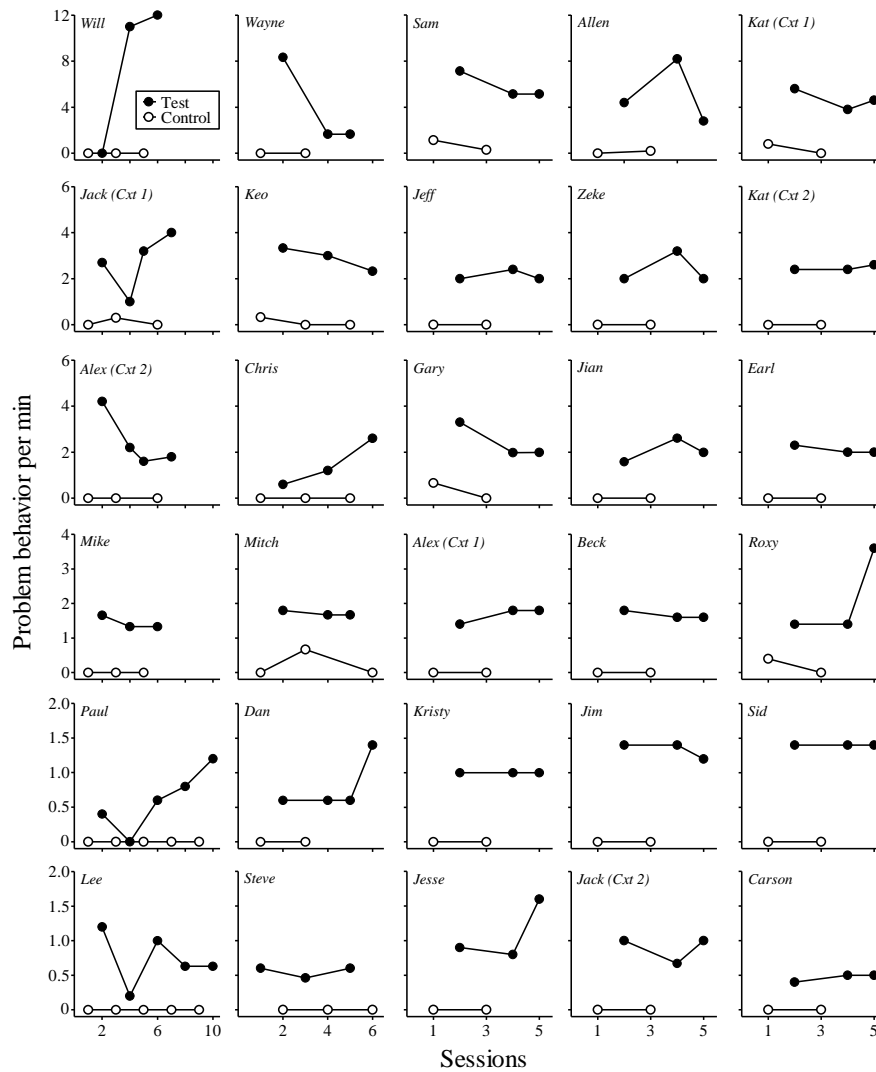

Loud
vocalizations,
disruption,
aggression, SIB

Analyst

Supervised
caregivers,
master's
candidates, BCBA

Settings

Outpatient clinic,
home, school, day
habilitation center

Median number of sessions:
5 sessions

Mean analysis duration:
25 min

Remember what a practical functional analysis provides

1. **A valid demonstration of the function of behavior**
2. **A stable and sensitive baseline from which to evaluate treatment**
3. **A properly motivating set of conditions to teach functional communication AND other important skills like:**
 - delay/denial tolerance
 - independent play
 - compliance with adult instructions

And keep in mind...

An effective analysis will lead to an effective treatment

25 additional participants

(Jessel, Ingvarsson, Kirk, Whipple, & Metras, in press)

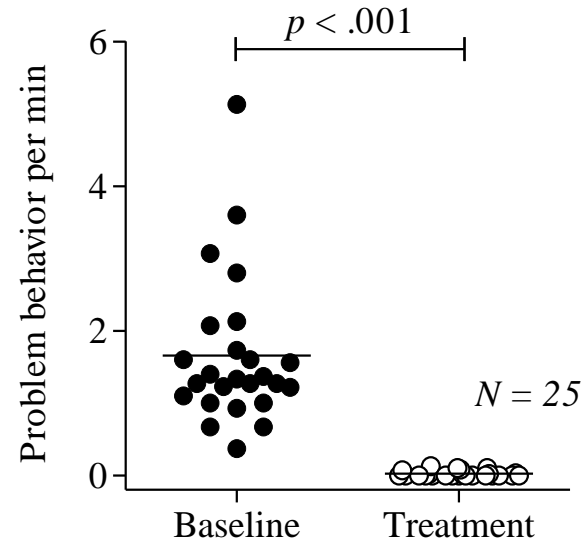

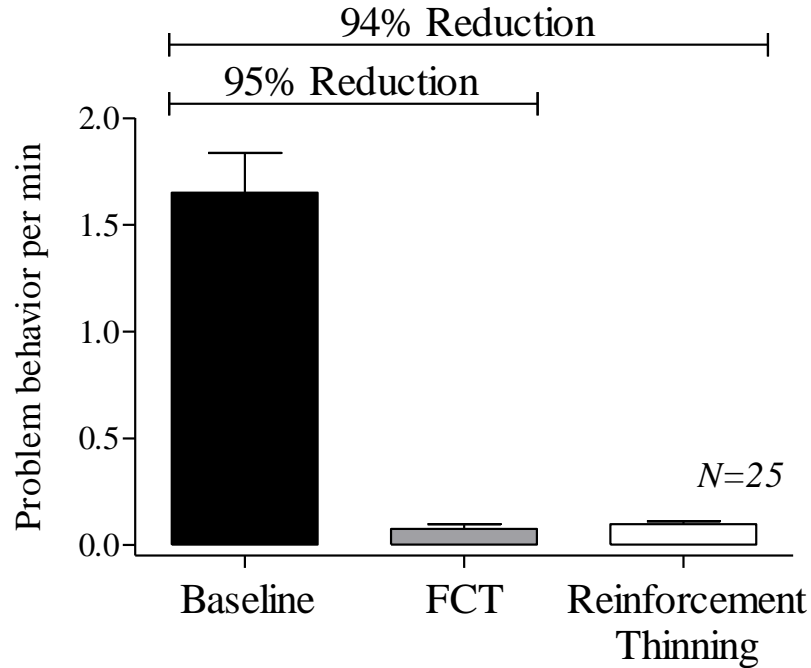

Negative Reinforcement

- Escape from transitions
- Escape from interactive play
- Escape from adult interaction
- Escape from instructions
- Escape from group work
- Escape from parent-selected DVDs
- Escape from adult-direct play
- Escape from blocked access to leisure items

Positive Reinforcement

- Access to iPad
- Access to independent play
- Access to interactive play
- Access to child-directed play
- Access to independent work
- Access to child-selected DVDs
- Uninterrupted access to leisure items

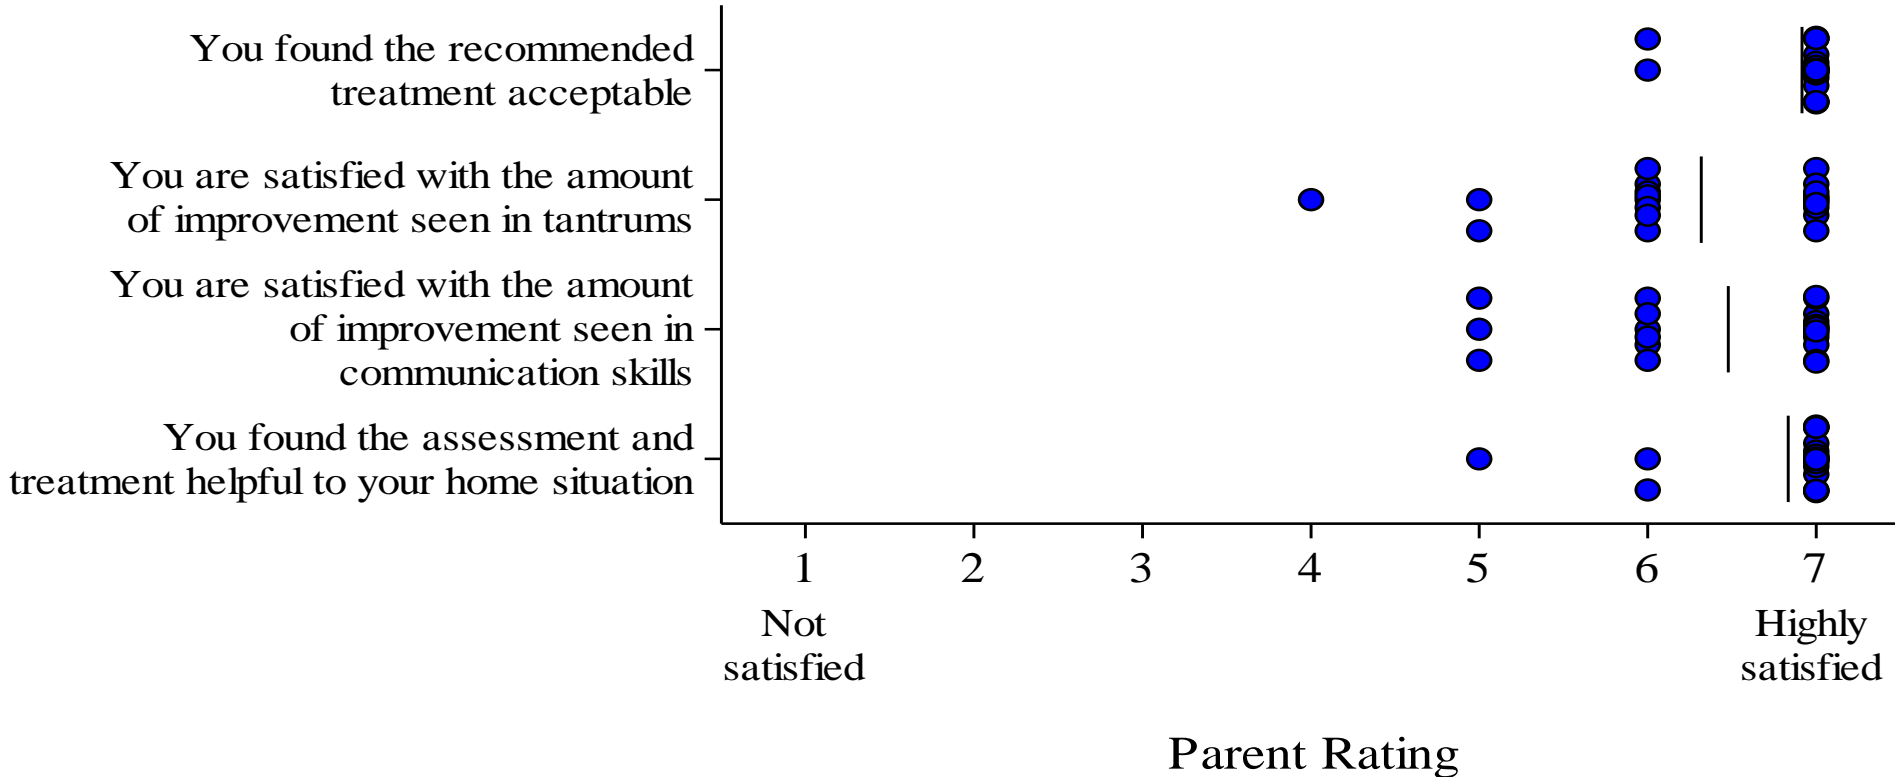

Socially Meaningful Outcomes: Over 94% Reduction in Problem Behavior

Socially Meaningful Outcomes: A 76% Reduction in Parental Concerns

Socially Meaningful Outcomes: High Satisfaction in Parental Reports

Developing Skill-Based Interventions

DRA

Punishment

The
Treatment
Buffet

Side step #2

What exactly makes a treatment effective?

1. Appropriate reduction in problem behavior
2. Maintenance of effects in typical environment
3. Meets expectations of caregivers, teachers, and clients
4. Improves overall living standards of the clients

How does some of our treatment buffet stack up?

Consider *DRO*:

1. Appropriate reduction in problem behavior
2. Maintenance of effects in typical environment
3. Meets expectations of caregivers, teachers, and clients
4. Improves overall living standards of the clients

How does some of our treatment buffet stack up?

Consider *Punishment*:

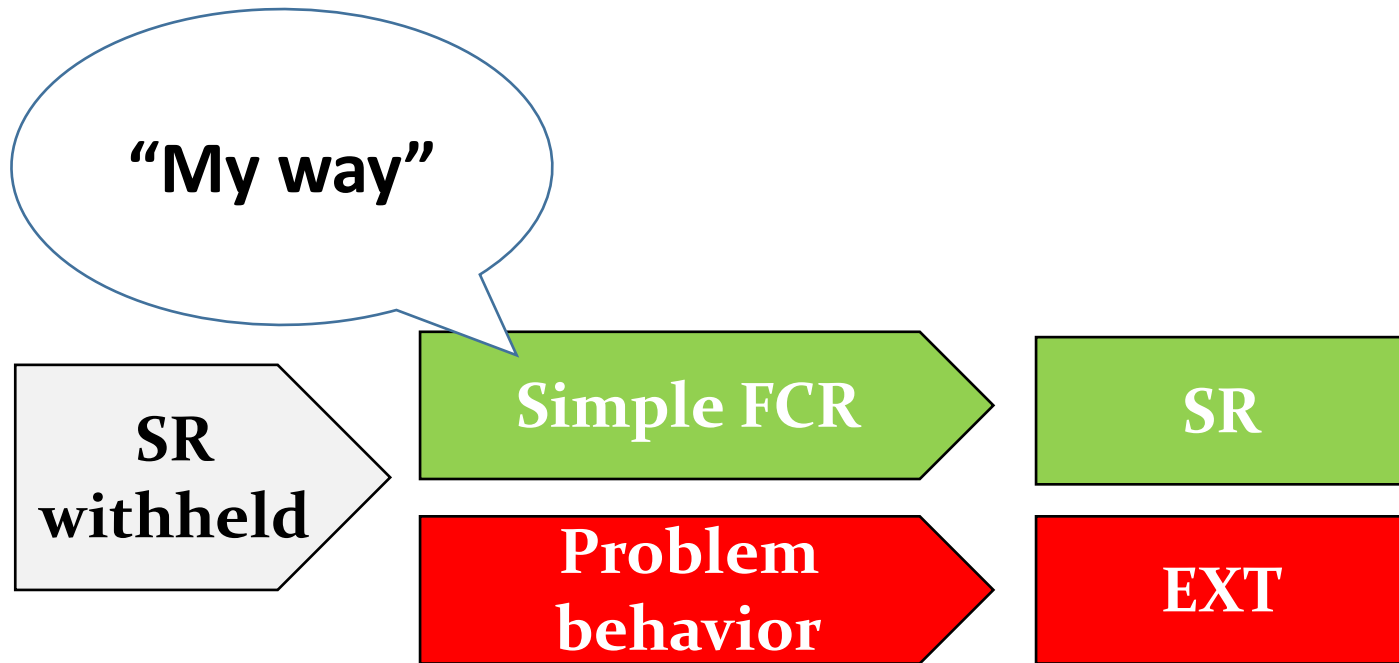

1. Appropriate reduction in problem behavior
2. Maintenance of effects in typical environment
3. Meets expectations of caregivers, teachers, and clients
4. Improves overall living standards of the clients

Four Steps to Creating a Effective Skill-Based Intervention

Step 1

Functional Communication Training

- a) Present reinforcers from FA contingent on a low effort and easy FCR only
- b) Present on a continuous reinforcement schedule
- c) After mastery of the first FCR build the complexity of the response until it is socially acceptable and recognizable means of communication
- d) Final FCR can include: eye contact, seeking communication partner, multiple mands, conversational niceties

“Excuse me, my way please”

“Excuse me, may I have my
way please?”

“Excuse me, may I have my
way please? Let’s play with the
[item]”

“Excuse me [name], [name]
took my [item]. Could you
please help me get it back?”

Case Example (Luke, 5 yo, dx: Autism)

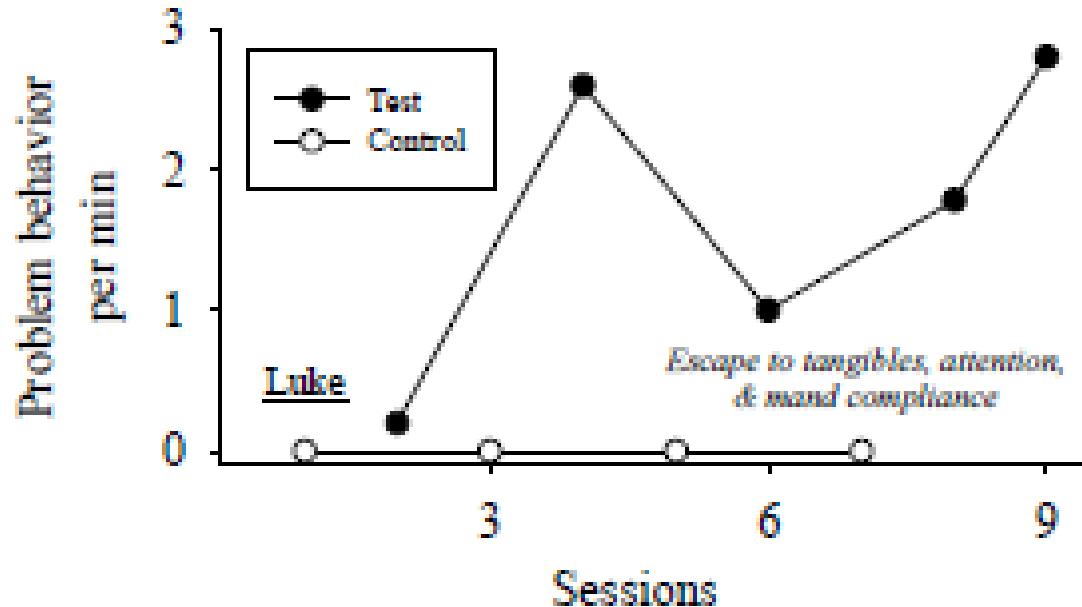

Mahshid Ghaemmaghmi, Gregory Hanley, Joshua Jessel, & Robin Landa (in press)

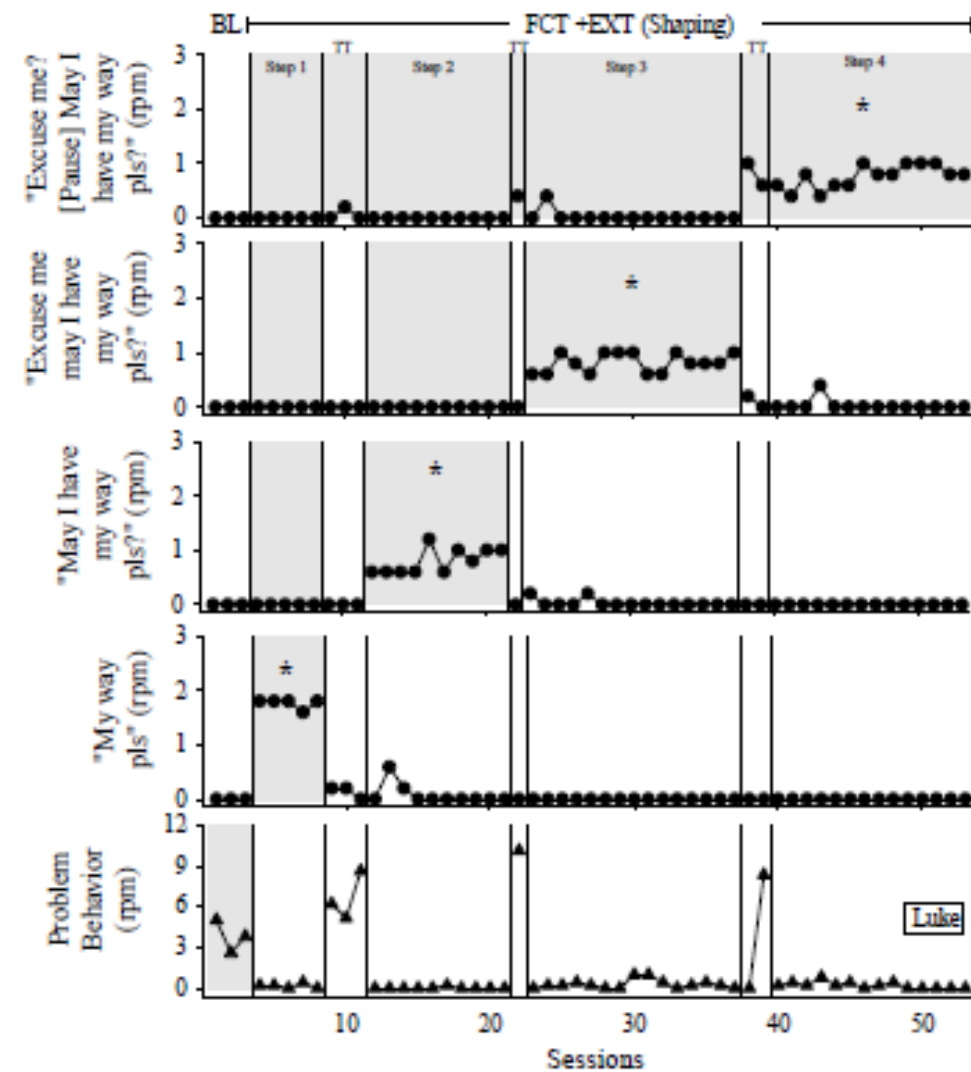

Setting: University Outpatient Clinic

Hypotheses:

Mike engages in meltdowns and aggression in order to:

Escape from parent-lead tasks to child-directed play

Pop Quiz

2. Describe his/her language abilities.

☐ Non-verbal ☐ 1-word utterances ☐ Short disfluent sentences ☐ Full fluency

Comments:

*Johnny can say “milk” when he is thirsty or “toy” when he wants his iPad.
We heard him say it before but it usually relies on pointing and grunting.*

- How would you describe his language abilities?
- What simple and complex FCRs would you teach following the functional analysis?

Step 2

Delay/Denial Tolerance Training

- a) Teach an appropriate response to denials
- b) Reinforce this response as you would any other response you want to strengthen
- c) Present reinforcers randomly (50/50) between the complex FCR and the tolerance response
- d) Build small delays naturally

A young girl with long dark hair and a white headband is shown from the chest up. She has a pouting, unhappy expression on her face. She is wearing a red and white vertically striped button-down shirt. The background is a solid dark red color. A semi-transparent red rectangular box is centered over the middle of the image, containing white text.

What is the face you get when you
tell a child no?

We don't want "no" to become aversive. We want "no" to signal options for getting everything back.

“Not right now”

Denial

“Ok, no problem”

Tolerance response

SR

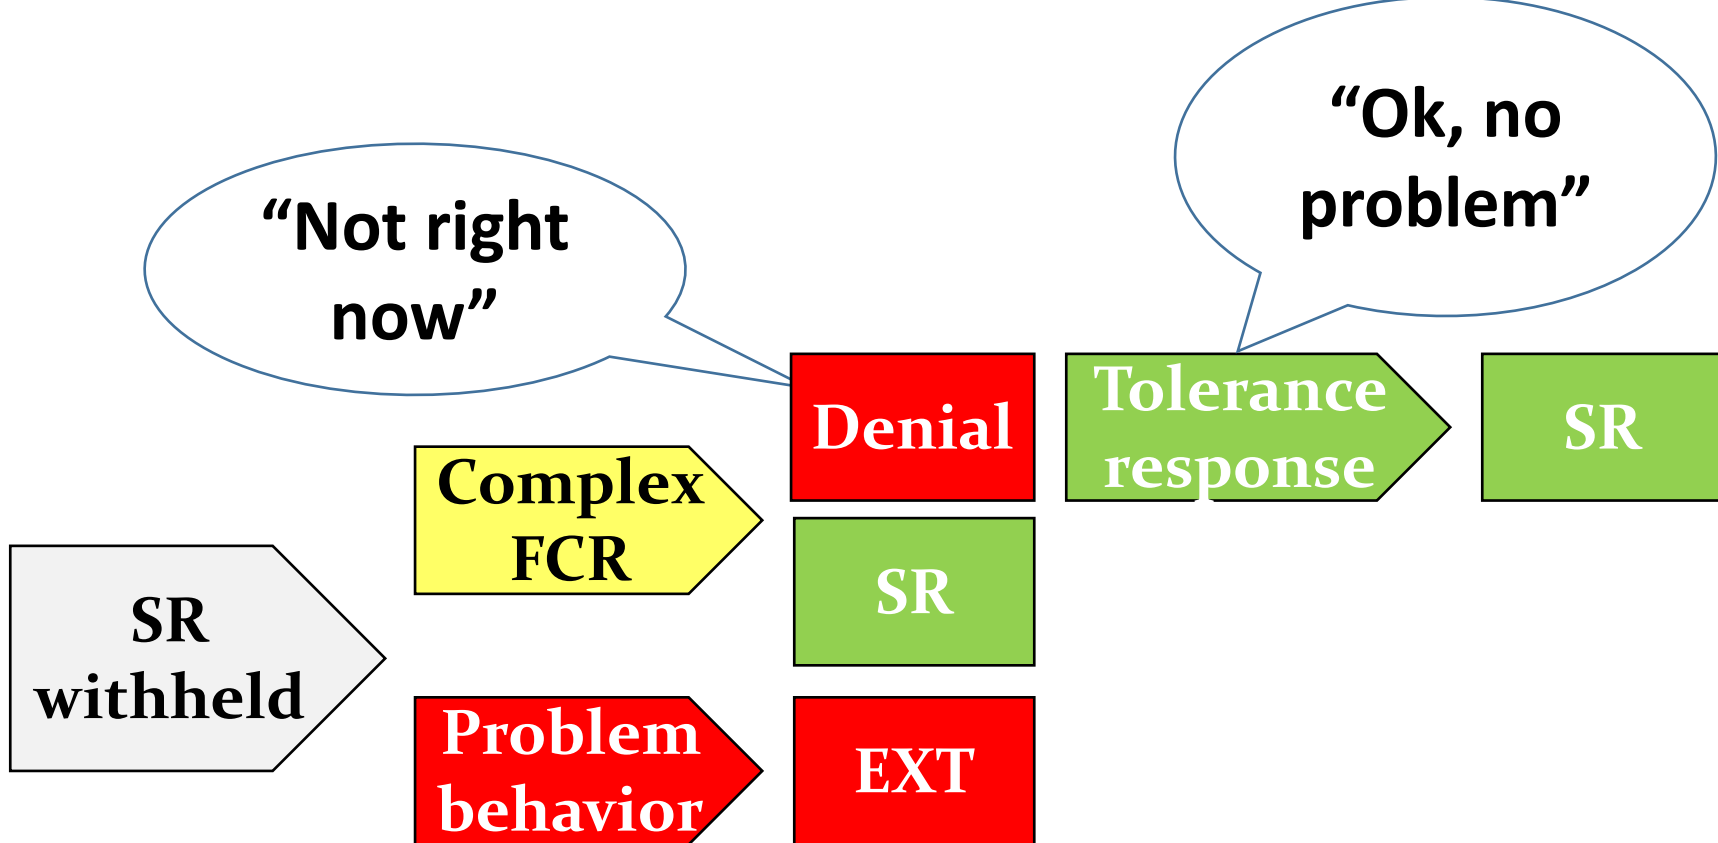

Complex FCR

SR

SR withheld

Problem behavior

EXT

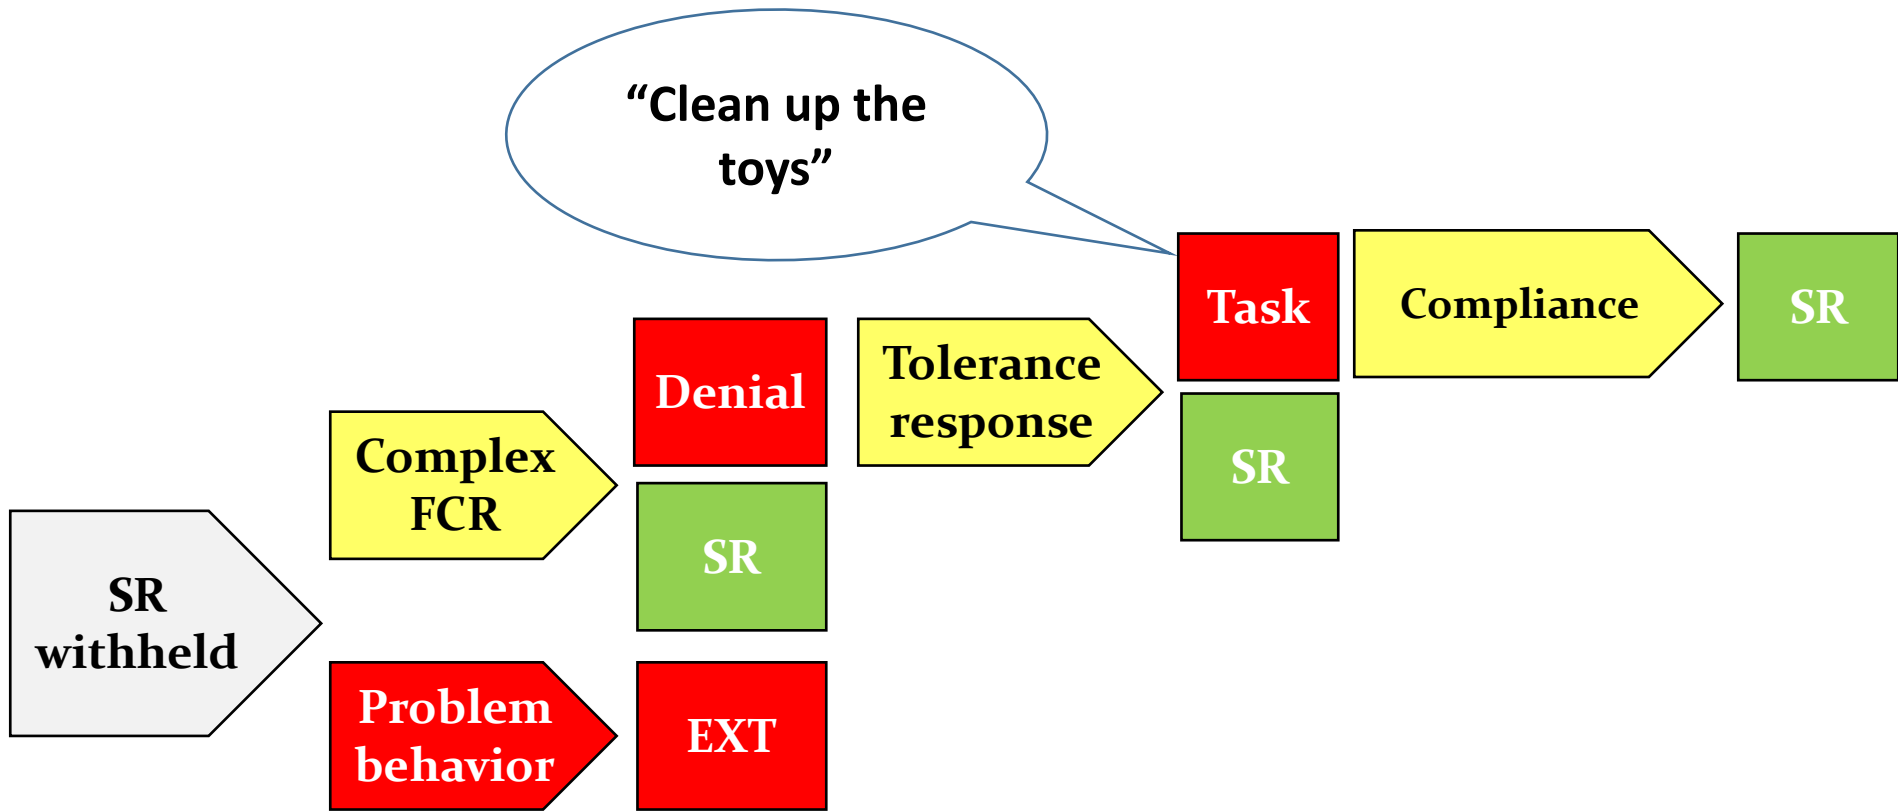

A young boy with dark hair is giving a thumbs up gesture. He has a slight, knowing smile on his face. A semi-transparent red rectangular box is overlaid on the center of the image, containing white text. The background is a blurred outdoor setting with green foliage.

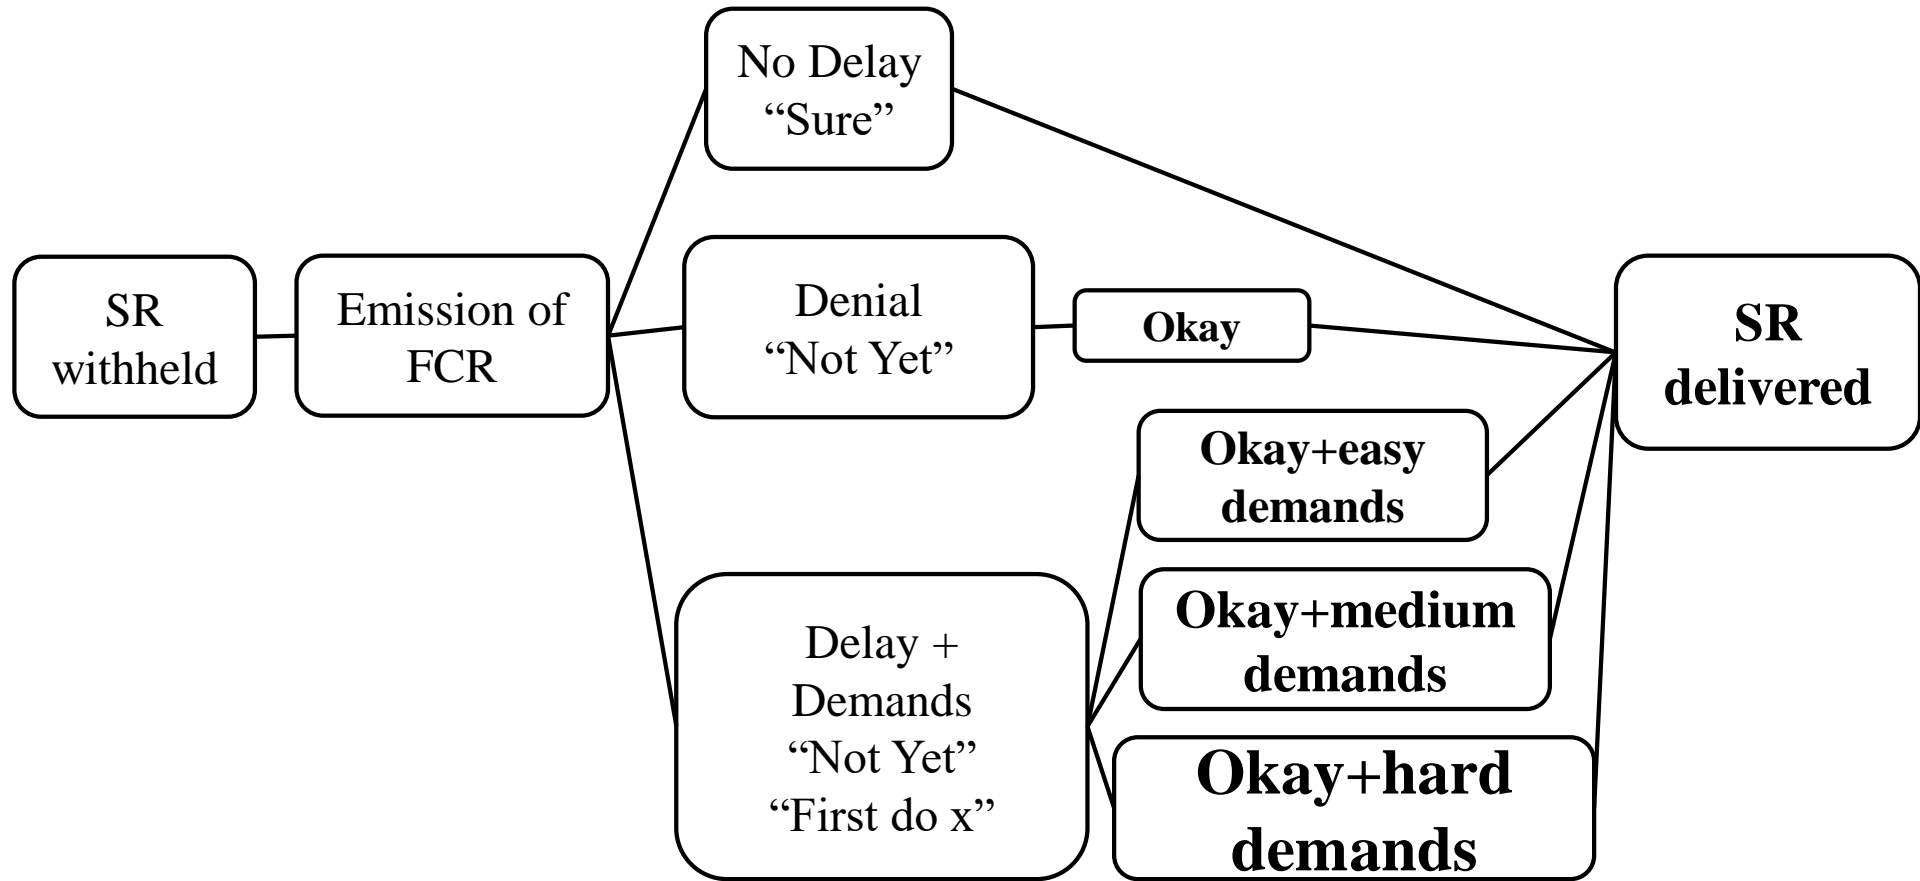

What is the face you're teaching
children to make after hearing no?

Step 3

Skill Building Training

- a) Teach alternative tasks following denials
- b) Reinforce this repertoire as you would any other repertoire you want to strengthen
- c) Present reinforcers randomly between the complex FCR, tolerance response, and the alternative available tasks
- d) Build the delays based on their behavior

Case Example (John, 7 yo, dx: Autism)

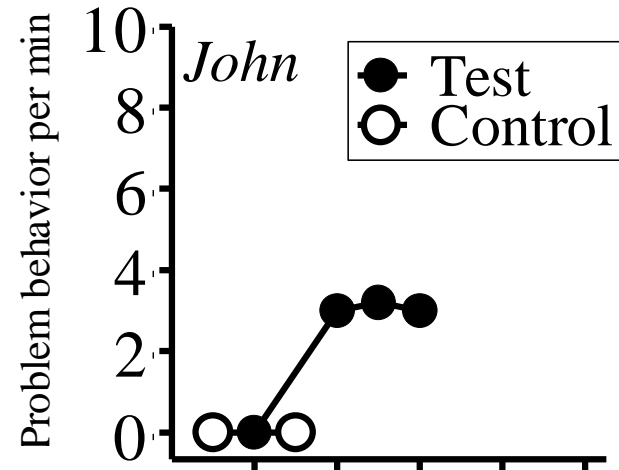

Jessel, Ingvarsson, Kirk, Whipple, & Metras (in press)

Setting: Outpatient Clinic

Hypotheses:

John engages in problem behavior in order to:

Escape from instructions to interactive play

Thinning Levels

1. Tolerance 4. 3/9/18
2. 1/1/1 5. 6/18/42
3. 1/2/3

Step 3

Tolerance for Unpredictability Training

- a) Remove any signals for
 - a) When the reinforcers will be presented
 - b) How much work is required
- b) Thin reinforcement to more natural/unpredictable schedules
- c) Slowly introduce different people, places, things
- d) Slowly introduce more difficult and natural instructions

Progressive Increase in Complexity of Instructions		
1	Simple motor movements	Walk over here, stand up, sit down, clap hands, touch [body part]
2	Simple academics	Draw shape, write name, copy what I write
	Homework/Task preparation	Unzip backpack, take out book, erase the board, put books on shelf
3	Complex academic: Reading skills	Read paragraph, answer question, sound out words
	Complex academic: Math skills	Solve addition/subtraction problem
	Self-help skills	Wash hands, do chores
	Play skills	Throw/kick ball

The world is a scary and unpredictable place. Make sure you train for that.

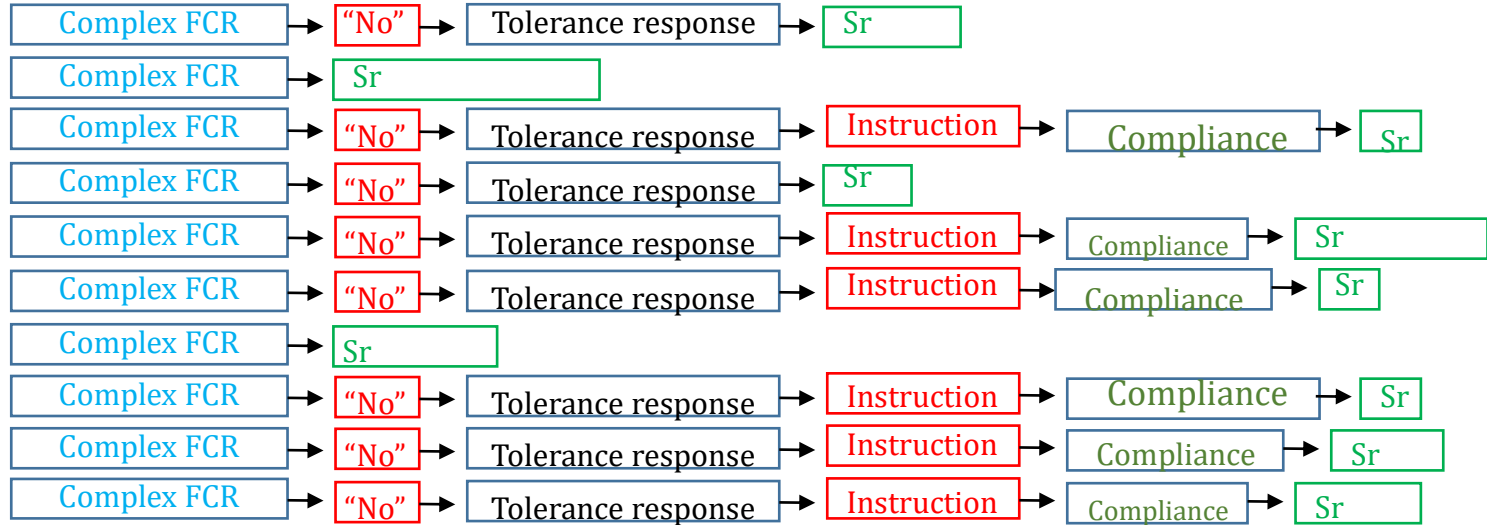

Reinforcement is:

**Function-based
Differential
Intermittent**

Reinforcement is:
 Function-based
 Differential
 Intermittent
 Variable in duration

Response requirement is:
 Variable
 Unpredictable

Start with your end goal and work
your way backwards

Case Example (Lenny, 8 yo, dx: Autism)

Team: Rachel Metras; Joshua Jessel (supervising BCBA-D)

Setting: Outpatient Clinic

Hypotheses:

Lenny engages in aggression, property destruction, and meltdowns in order to obtain:

Escape from academic instructions to access to preferred items

Parent and teacher end goal:

Lenny needs to be able to sit at a table and do his work independently without the need to of constant one-to-one supervision so the teacher can work with other students.

Backwards Design of Treatment:

- 5) Independent work completion without supervision
- 4) Work completion without problem behavior
- 3) Compliance with instructions
- 2) Socially acceptable communication for wants and needs
- 1) Simple communication for wants and needs

Reinforcement Thinning Steps

1	1/1/1 instructions
2	1/2/3 instructions
3	2/4/6 instructions
4	4/6/12 instructions
5	6/8/14 instructions
6	6/8/14 with 5 s checks
7	6/8/14 with 10 s checks
8	6/8/14 with 30 s checks
9	6/12/15 with 1 min checks
10	6/12/15 away from table and raise hand when done

A photograph of a sandy path leading through lush tropical vegetation towards a beach and the ocean under a blue sky with clouds. The path is flanked by dense greenery and palm trees on the left, and a stone wall and more trees on the right. The scene is bright and sunny, with shadows cast across the sand.

Final thoughts

Elimination of problem behavior is attainable

It is attainable

without drugs

without harsh punishment

without hospitalization

It is attainable

**With an understanding of why they are
engaging in the problem behavior and a
treatment focused on building complex
functional skills**
